3.5.2	Implementation of automatic dimension calculation	54
3.5.3	Actually typeset panels	57
3.6	Navigation helpers	58
3.7	Set acrobat reader's page transition mode	61
3.8	Set acrobat reader's automatic page advancing feature	62
3.9	TeXPower kernel	64
3.9.1	Overload \shipout	64
3.9.2	The kernel functions to be executed at \shipout	65
3.9.3	Implementation of 'fixcolorstack' option	67
3.9.4	Kernel functions for overloading \output	69
3.9.5	Kernel functions for re-inserting page contents	71
3.9.6	Implementation of \pause	72

*This document corresponds to **texpower** v0.2, dated 2005/04/08.

3.9.7	Implementing \stepwise and all functions surrounding it	72
3.9.8	Command administration	73
3.9.9	Registers	73
3.9.10	Custom commands for displaying step contents	74
3.9.11	Custom commands for ‘hiding’ stepcontents	74
3.9.12	Displaying and hiding of step contents	76
3.9.13	Implementation of \step, \switch and relatives	80
3.9.14	Implementation of \stepwise	89
3.9.15	Implementation of the fragilesteps environment	94
3.9.16	Input system-specific settings	95

1 Introduction

LaTeX Package for creating ‘dynamic’ presentations.

The user documentation is found in `manual.tex` and the FAQ. Only the implementation documentation is covered in this document.

The TeXPower Bundle can be found at <http://texpower.sourceforge.net/>

2 Disclaimer

This is still work in progress.

During the subsequent error correction and extension of the functionality, the syntax and implementation of the macros are liable to change.

Even though we are using dtx-files, these are still not fully documented dtx-files.

3 Implementation

We need the programming tools provided by these packages.

```
1 \RequirePackage{ifthen}
2 \RequirePackage{calc}
3 \RequirePackage{keyval}
```

3.1 Options and general setup

3.1.1 General options

The option verbose turns on some automatic messages.

```
4 \newboolean{verbose@TP}
5 \DeclareOption{verbose}{\setboolean{verbose@TP}{true}}
```

The (global) option display is respected and turns on the ‘dynamic’ features.

```
6 \provideboolean{display}
7 \DeclareOption{display}{\setboolean{display}{true}}
```

The option printout turns off the ‘dynamic’ features. Can be used to undo a default setting of display.

```
8 \DeclareOption{printout}{\setboolean{display}{false}}
```

The option fixcolorstack switches on a ‘color stack correction’ method which undoes damage to the driver’s color stack when “color push” and “color pop” specials are duplicated.

```
9 \newboolean{fixcolorstack@TP}
10 \DeclareOption{fixcolorstack}{\setboolean{fixcolorstack@TP}{true}}
```

The option oldfiltering reverts to the old (pre v0.2) aggressive/robust filtering of whatsits.

```
11 \newboolean{oldfiltering@TP}
12 \DeclareOption{oldfiltering}{\setboolean{oldfiltering@TP}{true}}
13 \newcommand{\oldfilteringon}{\setboolean{oldfiltering@TP}{true}}
14 \newcommand{\oldfilteringoff}{\setboolean{oldfiltering@TP}{false}}
```

The option nineminutes sets the page duration of every single page to a high value (of about nine minutes; this seems to be a hardcoded upper limit in acrobat 5; see below). This way, a setting in acrobat reader’s fullscreen dialogue is masked. Otherwise, pages without an explicit page duration setting don’t get any page duration setting at all, so they will follow the dialogue setting.

```
15 \newboolean{ninemminutes@TP}
16 \DeclareOption{ninemminutes}{\setboolean{ninemminutes@TP}{true}}
```

3.1.2 Color options

The following switch indicates whether color management should be turned on at all.

```
17 \newboolean{TPcolor}
```

The option coloremph makes `\em` and `\emph` switch the text color instead of the font shape.

```
18 \newboolean{coloremph@TP}
19 \DeclareOption{coloremph}
20 {\setboolean{TPcolor}{true}\setboolean{coloremph@TP}{true}}
```

The option colormath makes math formulae be color highlighted.

```
21 \newboolean{colormath@TP}
22 \DeclareOption{colormath}
23 {\setboolean{TPcolor}{true}\setboolean{colormath@TP}{true}}
```

The option colorhighlight makes highlighting commands use colors.

```
24 \newboolean{colorhighlight@TP}
25 \DeclareOption{colorhighlight}
26 {\setboolean{TPcolor}{true}\setboolean{colorhighlight@TP}{true}}
```

The option whitebackground selects standard colors for white backgrounds.

```
27 \newboolean{whitebackground@TP}
28 \setboolean{whitebackground@TP}{true} % This is the default.
29 \DeclareOption{whitebackground}
30 {\setboolean{TPcolor}{true}\setboolean{whitebackground@TP}{true}}
```

The option lightbackground selects standard colors for light (but not white) backgrounds.

```
31 \newboolean{lightbackground@TP}
32 \DeclareOption{lightbackground}
33 {\setboolean{TPcolor}{true}\setboolean{lightbackground@TP}{true}}
```

The option blackbackground selects standard colors for black backgrounds.

```
34 \newboolean{blackbackground@TP}
35 \DeclareOption{blackbackground}
36 {\setboolean{TPcolor}{true}\setboolean{blackbackground@TP}{true}}
```

The option darkbackground selects standard colors for dark (but not black) backgrounds.

```
37 \newboolean{darkbackground@TP}
38 \DeclareOption{darkbackground}
39 {\setboolean{TPcolor}{true}\setboolean{darkbackground@TP}{true}}
```

Load the config file with default options if file exists.

```
40 \InputIfFileExists{tptoptions.cfg}{}{}
```

Process options.

```
41 \ProcessOptions
42
43 \ifthenelse{\boolean{display}}
44 {\PackageInfo{texpower}{Producing display version. Dynamic features activated.}}
45 {\PackageInfo{texpower}{Producing printout version. Dynamic features inactive.}}
```

General option-driven initialization.

If the verbose option is set, we give a lot of context information when an error is raised.

```
46 \ifthenelse{\boolean{verbose@TP}}{\setcounter{errorcontextlines}{10000}}{}
```

Driver-specific defaults.

We provide a switch which (hopefully) allows to distinguish whether postscript specials (as used by PSTricks) can be used safely or not.

```
47 \newboolean{psspecialsallowed}
48 \setboolean{psspecialsallowed}{true} % optimistic default
```

The switch \ifpdf is to determine whether pdfTeX is being run and outputting pdf, using Heiko Oberdiek's faultproof pdf detector:

```
49 \@ifundefined{pdftrue}{
50 \IfFileExists{ifpdf.sty}{\RequirePackage{ifpdf}}{%
51 \expandafter\newif\csname ifpdf\endcsname
52 \ifx\pdfoutput\undefined
53 \else
54 \ifx\pdfoutput\relax
55 \else
56 \ifcase\pdfoutput
57 \else
58 \pdftrue
59 \fi
60 \fi
61 \fi
62 }
63 }% \ifpdf is defined - nothing to do
64
65
66 \ifpdf\setboolean{psspecialsallowed}{false}\fi
```

Class-specific defaults.

The following switches centering of slides off for the slides document class because this would disturb dynamic building of slides.

```

67 \O@ifclassloaded{slides}%
68 {%
69   \ifthenelse{\boolean{display}}{%
70     {\let\@topfil\relax}%
71   }%
72 }%
73 {}
```

Some registers and macros for general use throughout texpower.sty.

```

74 \newcounter{tmpcnta@TP}
75 \newcounter{tmpcntb@TP}
76
77 \newlength{\tempdima@TP}
78 \newlength{\tempdimb@TP}
79
80 \newbox\tempbox@TP
81
82 \newboolean{carryon@TP}
```

These are needed for calculating the size of the page background box.

```

83 \newcommand{\TPpagewidth}{\strip@pt\paperwidth truept}
84 \newcommand{\TPpageheight}{\strip@pt\paperheight truept}
85 % \AtBeginDocument
86 % {%
87 %   \edef\TPpagewidth{\strip@pt\paperwidth truept}%
88 %   \edef\TPpageheight{\strip@pt\paperheight truept}%
89 % }
```

\mkfactor **\mkfactor{<cs>}{<exp>}** is a helper command for automatically generating the fixed point numbers between 0 and 1 which are employed by the color calculation commands. **<exp>** can be anything which can stand behind * in calc (for instance: **\value{counter}/\value{maxcounter}** or **\ratio** or whatever). **<cs>** should be a valid macro name. **<exp>** is converted into a fixed-point representation which is then assigned to **<cs>**.

```

90 \newcommand{\mkfactor}[2]%
91 {\setlength{\tempdima@TP}{1pt*#2}\edef#1{\strip@pt\tempdima@TP}}
```

Make a string representation of a length expression.

```

92 \newcommand{\mklength@TP}[2]
93 {\setlength{\tempdima@TP}{#2}\edef#1{\the\tempdima@TP}}
94
95 \newcommand{\mklength}{}
96 \let\mklength\mklength@TP
```

3.2 Color management, color emphasis and highlighting

Initialization.

If we are to use colors, we need the color package.

```
97 \ifthenelse{\boolean{TPcolor}}{\RequirePackage{color}}{}%
```

3.2.1 Color management kernel

Only load the kernel if TeXPower's color management is active.

```
98 \ifthenelse{\boolean{TPcolor}}{\% Yes.}
```

We need a hook which can be defined otherwise to turn off colors.

```
99 \let\setcolor@TP=\color%
```

Overload `\definecolor` to store a ‘driver-independent’ copy of the color definition for later use by `\colorbetween` and relatives.

```
100 \let\o@definecolor@TP=\definecolor%
101 \def\definecolor#1#2#3%
102 {%
103   \o@definecolor@TP{#1}{#2}{#3}%
104   \expandafter\edef\csname colordef@TP@#1\endcsname%
105   {\csname processcolor@TP@#2\endcsname{#3}}%
106 }%
```

Repeat `color.sty`’s standard color definitions to make the original definitions available to TeXPower. Begin excerpt from `color.sty`:

```
107 \@ifundefined{c@lor@namefile}{}{\input{\c@lor@namefile}}
108
109 \ifx\color@gray\@undefined
110   \ifx\color@rgb\@undefined
111     \else
112       \definecolor{black}{rgb}{0,0,0}
113       \definecolor{white}{rgb}{1,1,1}
114     \fi
115   \else
116     \definecolor{black}{gray}{0}
117     \definecolor{white}{gray}{1}
118   \fi
119 \ifx\color@rgb\@undefined\else
120   \definecolor{red}{rgb}{1,0,0}
121   \definecolor{green}{rgb}{0,1,0}
122   \definecolor{blue}{rgb}{0,0,1}
123 \fi
124 \ifx\color@cmypk\@undefined\else
125   \definecolor{cyan}{cmypk}{1,0,0,0}
126   \definecolor{magenta}{cmypk}{0,1,0,0}
127   \definecolor{yellow}{cmypk}{0,0,1,0}
128 \fi
```

End excerpt from `color.sty`.

3.2.2 Commands for calculating new colors

`\interpolate@TP` Calculates the weighted average between two fixed point values.

```
129 \newcommand{\interpolate@TP}[3]%
130 {%
131   \setlength{\tempdima@TP}{1pt-#1pt}% Calculate the second factor for the weight
132   \edef\secondfactor@TP{\strip@pt\tempdima@TP}%
133   \setlength{\tempdima@TP}{#2pt*\real{#1}+#3pt*\real{\secondfactor@TP}}% Calculate the weight
134   \ifthenelse{\lengthtest{\tempdima@TP<0pt}}% Bound the result to the interval [0,1]
135   {\setlength{\tempdima@TP}{0pt}}% factor was not from [0,1]).
136   {\ifthenelse{\lengthtest{\tempdima@TP>1pt}}{\setlength{\tempdima@TP}{1pt}}{}%}
137   \edef\result@TP{\strip@pt\tempdima@TP}%
138 }
```

`\interpolate@three@TP` Interpolates a three-piece color value.

```

139  \def\interpolate@three@TP#1,#2,#3,#4,#5,#6;#7%
140  {%
141      \interpolate@TP{#7}{#1}{#4}%
142      \edef\newcolordef@TP{\result@TP,}%
143      \interpolate@TP{#7}{#2}{#5}%
144      \edef\newcolordef@TP{\newcolordef@TP\result@TP,}%
145      \interpolate@TP{#7}{#3}{#6}%
146      \edef\newcolordef@TP{\newcolordef@TP\result@TP,}%
147      \}
148
149  \def\interpolate@four@TP#1,#2,#3,#4;#5,#6,#7,#8;#9%

218  \newcommand{\processcolor@TP@gray}{[3]}%
219  {%

```

\colorbetween[<factor>]{<target>}{<source1>}{<source2>} calculates a ‘weighted average’ between two colors. <source1> and <source2> are the names of the two colors. <factor> (default: 0.5) is a fixed-point number between 0 and 1 giving the ‘weight’ for the interpolation between <source1> and <source2>. <target> is the name to be given to the resulting mixed color. If <factor> is 1, then <target> will be identical to <source1> (up to color model conversions, see below), if <factor> is 0, then <target> will be identical to <source2>, if <factor> is 0.5, then <target> will be exactly in the middle between <source1> and <source2>.

\colorbetween supports the following color models: rgb, RGB, gray, cmyk, hsb. If both colors are of the same model, the resulting color is also of the respective model. If <source1> and <source2> are from different models, then <target> will always be an rgb color. The only exception is the hsb color model: As I don’t know how to convert hsb to rgb, mixing hsb with another color model will always raise an error.

```

220      \ifx##2\processcolor@TP@gray%          Are both colors gray colors?
221          \interpolate@TP{#1}{##1}{##3}%

```

3.3 Color name and color set management

\replacecolor \replacecolor[<tset>]{<tcol>}[<sset>]{<scol>} will make <tcol> have the same definition as <scol> (if <scol> is defined at all), where <tcol> and <scol> are color names as given in the first argument of \definecolor. If (one of) <tset> and <sset> are given, the colors will be taken from the respective color sets.

```

315 \newcommand{\replacecolor}

533 \replacecolor{emcolor}{altemcolor}%	
534 \replacecolor{altemcolor}{tmp@TP}% 535 }% 536 }% 537 {}% No; keep original definition.	

3.3.2 Implementation of the `colormath` option

Note that the following code is quite fragile and contains some modifications of LaTeX internals. Thus it is likely to cause trouble, especially in conjunction with

other packages modifying the LaTeX kernel. The array package is supported, but no explicit support of other packages exists. If you experience strange and inexplicable errors while the colormath option is active, first of all try switching it off to see whether anything changes. The implementation of colormath is likely to change several times before the first beta release, so expect backward incompatible changes in behaviour.

```
538 \ifthenelse{\boolean{colormath@TP}}%  
539 {  
540   \AtBeginDocument  
541 }
```

Should we color math?

The most basic magical incantation: Color inline math using `\everymath`. Beware of side effects of this hack.

```
542 \expandafter\everymath\expandafter{\the\everymath\color{mathcolor}}%
```

Color displayed math by overloading LaTeX's own math environments. Note that this doesn't work for the TeX notation \$\$, which is deprecated in LaTeX anyway. Note further that for the eqnarray and eqnarray* environments, the current implementation places the color change command **outside** the math environment (for technical reasons; maybe this can be remedied by a more sophisticated implementation), which will almost invariably lead to unwanted extra vertical space before and after equation arrays. Currently there is no clean remedy, apart from using amsmath's align environment.

```

Container for the minipage to be boxed
First a small space to separate the area from the minipage
Save the contents in a minipage inside the colored box
Reduce the width of the minipage to leave room for the border
If \present is used inside the colored box, the minipage is typeset directly
This typesets the saved minipage inside the colored box
A small space to separate the area from the minipage

```

3.4 Structured rules, box and page backgrounds

3.4.1 Structured rules

Some configurable defaults for rules and box backgrounds.

Default number of stripes for gradient rules and box backgrounds.

```
730 \newcommand{\rulestripes}{10}
```

Default stripe overlap for avoiding ‘gaps’ in color gradients.

```
731 \newcommand{\stripeoverlap}{.15pt}
```

Default gradient progression for rules and box backgrounds (single gradients or first part of double gradients).

```
732 \newcommand{\rulefirstgradprogression}{1}
```

Default gradient progression for rules and box backgrounds (second part of double gradients).

```
733 \newcommand{\rulesecondgradprogression}{1}
```

Default position of the ‘middle’ color of a double gradient.

```
734 \newcommand{\rulegradmidpoint}{.5}
```

The following are used internally when making color gradients.

```
735 \newcounter{stripe@TP}

\vgradrule \vgradrule[<stripes>][<startmodel>]{<startcolor>}[<endmodel>]{<endcolor>}[<raise>]{<wi
creates a rule-like object consisting of a vertical color gradient composed of horizontal stripes.
```

The topmost stripe has color `{<startcolor>}`, the bottommost stripe has color `{<endcolor>}`. Inbetween, color changes gradually from top to bottom. The colors are specified exactly as for the `\color` command: if the optional argument `<startmodel>` is given, `<startcolor>` contains an explicit definition of a color from model `<startmodel>`, otherwise `<startcolor>` is the name of a defined color. The same holds for `<endmodel>` and `<endcolor>`.

The arguments `[<raise>]{<width>}{<height>}` work exactly as for the `\rule` command.

The optional argument `<stripes>`, if given, should contain a (calc expression for a) number specifying the number of stripes. If `<stripes>` is not given, the default is the content of `\rulestripes` (default 10).

There is one more parameter which is not given as an argument. The control sequence `\rulefirstgradprogression` should expand to an (calc expression for an) integer. This value (default 1) controls the ‘order’ of progression from `<startcolor>` to `<endcolor>`. The default value 1 means linear progression. 2 means quadratic progression, i.e. color values ‘nearer’ to `<endcolor>` are reached ‘later’ (the square of 0.5, for instance, is 0.25, i.e. in the geometric middle point of the rule produced, the color gradient will have traveled only to one quarter of the ‘distance’ between `<startcolor>` and `<endcolor>`). 3 means cubic progression and so on. 0 and -1 mean the same as 1. -2 means quadratic progression “from bottom to top”, i.e. color values ‘nearer’ to `<endcolor>` are reached ‘earlier’, and analogously for -3, -4, ...

If you wish to give the second optional argument but not the first, just write `\vgradrule[] [<startmodel>]...`

```

771 \newcommand{\vgradrule}[1][]% Pick up first optional argument: [<stripes>]

\dblvggradrule \dblvggradrule[<midpoint>] [<stripes>] [<startmodel>]
 {<startcolor>} [<midmodel>] {<midcolor>} [<endmodel>]
 {<endcolor>} [<raise>] [<width>] [<height>] creates a rule-like object consisting of a vertical color gradient composed of horizontal stripes.

The behaviour is exactly like \vgradrule, only in addition to the defined ‘start’ and ‘end’ color, there is an additional defined ‘middle’ color. The color gradient first progresses from the start to the middle color and then from the middle to the end color.

[<midmodel>] {<midcolor>} specify the middle color exactly as described for the other colors in the description of \vgradrule.

The additional optional parameter <midpoint> is a fixed-point value specifying where in the produced gradient the middle color is placed. 0 means the middle color replaces the start color; 1 means the middle color replaces the end color; 0.5 means the middle color is placed in the geometric middle between start and end color. If <midpoint> is not given, the default is the content of \rulegradmidpoint (default 0.5).

There is another parameter not passed as an argument: while \rulefirstgradprogression specifies the order of progression from first to middle color as described for \vgradrule, \rulesecondgradprogression specifies the order of progression from middle to end color.

If you wish to give one from the first row of optional arguments but not the other(s), any one can be replaced by [] to use the default.

```

3.4.2 Structured box backgrounds

\vgradbox \vgradbox[<stripes>][<startmodel>]{<startcolor>}[<endmodel>]{<endcolor>}{<content>} creates an mbox containing <content>, which has a background made up of a vertical color gradient. In fact, the background exceeds the extent of <content> by the value of \fboxsep on every side, just like the \colorbox command from the color package.

The gradient background is constructed using the \vgradrule command; see the description of \vgradrule on the way the gradient is constructed and on the meaning of the parameters <stripes>, <startmodel>, <startcolor>, <endmodel>, <endcolor> and the additional parameter \rulefirstgradprogression which has the same meaning for \vgradbox as for \vgradrule.

```

1251 \newcommand{\vgradbox}[1][]% Pick up first optional argument: [<stripes>].
1252 {%
1253   \let\firstgradprogression@TP=\rulefirstgradprogression% Use progression parameter for rules

1281      {\ht\tempbox@TP+\dp\tempbox@TP+2\fboxsep}%
1282      \box\tempbox@TP%
1283 }%                                         Box depth augmented by 'white' space.
                                                Space on the sides has already been added.
                                                Total height.
                                                Overlay box contents.

\hgradbox \hgradbox[<stripes>][<startmodel>]{<startcolor>}[<endmodel>]{<endcolor>}{<content>}
acts like \vgradbox, but creates the background using \hgradrule. See comments above.

3.4.3 Structured page backgrounds

\backgroundstyle \backgroundstyle[<options>]{<style>} is the central command for structured page backgrounds. It works like \pagestyle and other commands of this type. This means <style> is a symbolic name specifying the general method by which

the page background is constructed. The detailed construction is influenced by parameters which can be set in `<options>`. If given, the optional parameter `<options>` should contain a list of settings in “keyval” manner. The keyval method (which is used by the `\includegraphics` command from the `graphicx` package, for instance) is based on associating a symbolic name with every parameter. `<options>` is then a comma-separated list of parameter settings of the form `<name>=<value>`, where `<name>` is the symbolic name of the parameter to be set and `<value>` is the value it is to be set to. Not every `<style>` evaluates every parameter. In the following, a description of all styles, together with lists of the parameters employed, is given. It is followed by a list of all parameters. Note that some parameter names internally access the same parameter. For instance, parameters `startcolor` and `startcolordef` both set the start color of a color gradient. In case of conflict, the last setting in the list `<options>` will prevail. It is noted in the list of parameters which other parameters are overwritten.

`<style>` may have one of the following values:

none	No background. This means the page background is whatever it would be if <code>\backgroundstyle</code> wasn't used at all (for instance, a plain area of color page-color if one of the color options has been given). Parameters used: none.
plain	Plain background. This means the page background is whatever it would be if <code>\backgroundstyle</code> wasn't used at all (for instance, a plain area of color page-color if one of the color options has been given). In addition to background style “none”, the background style “plain” does produce panel backgrounds. The colors and dimensions of a “top panel”, “bottom panel”, “left panel”, and “right panel” can be specified. Parameters used: <code>hpansels</code> , <code>autopanels</code> , <code>toppanelcolor</code> , <code>bottompanelcolor</code> , <code>leftpanelcolor</code> , <code>rightpanelcolor</code> , <code>toppanelcolordef</code> , <code>bottompanelcolordef</code> , <code>leftpanelcolordef</code> , <code>rightpanelcolordef</code> , <code>toppanelheight</code> , <code>bottompanelheight</code> , <code>leftpanelwidth</code> , <code>rightpanelwidth</code> .

vgradient	<p>Vertical gradient. The page background is constructed using the <code>\vgradrule</code> command. In addition to the usual parameters of gradient rules, the vgradient background style allows to leave space for headers, footers, or panels. The colors and dimensions of a “top panel”, “bottom panel”, “left panel”, and “right panel” can be specified. The gradient rule fills the rectangular space left between the specified panels.</p> <p>Parameters used: stripes, firstgradprogression, startcolor, startcolordef, endcolor, endcolordef, hpanels, autopanels, toppanelcolor, bottompanelcolor, leftpanelcolor, rightpanelcolor, toppanelcolordef, bottompanelcolordef, leftpanelcolordef, rightpanelcolordef, toppanelheight, bottompanelheight, leftpanelwidth, rightpanelwidth.</p>
hgradient	<p>Horizontal gradient. The page background is constructed using the <code>\hgradrule</code> command. See the description of vgradient concerning panels.</p> <p>Parameters used: stripes, firstgradprogression, startcolor, startcolordef, endcolor, endcolordef, hpanels, autopanels, toppanelcolor, bottompanelcolor, leftpanelcolor, rightpanelcolor, toppanelcolordef, bottompanelcolordef, leftpanelcolordef, rightpanelcolordef, toppanelheight, bottompanelheight, leftpanelwidth, rightpanelwidth.</p>
doublevgradient	<p>‘Double’ vertical gradient. The page background is constructed using the <code>\dblvggradrule</code> command. See the description of vgradient concerning panels.</p> <p>Parameters used: stripes, gradmidpoint, firstgradprogression, secondgradprogression, startcolor, startcolordef, midcolor, midcolordef, endcolor, endcolordef, hpanels, autopanels, toppanelcolor, bottompanelcolor, leftpanelcolor, rightpanelcolor, toppanelcolordef, bottompanelcolordef, leftpanelcolordef, rightpanelcolordef, toppanelheight, bottompanelheight, leftpanelwidth, rightpanelwidth.</p>

`doublehgradient` ‘Double’ horizontal gradient. The page background is constructed using the `\dblhgradrule` command. See the description of `vgradient` concerning panels. Parameters used: `stripes`, `gradmidpoint`, `firstgradprogression`, `secondgradprogression`, `startcolor`, `startcolordef`, `midcolor`, `midcolordef`, `endcolor`, `endcolordef`, `hpanels`, `autopanels`, `toppanelcolor`, `bottompanelcolor`, `leftpanelcolor`, `rightpanelcolor`, `toppanelcolordef`, `bottompanelcolordef`, `leftpanelcolordef`, `rightpanelcolordef`, `toppanelheight`, `bottompanelheight`, `leftpanelwidth`, `rightpanelwidth`.

Now, a list of all parameters and their meaning. In the following,

<code><n></code>	denotes a (calc expression for a) nonnegative integer
<code><i></code>	denotes a (calc expression for an) integer
<code><r></code>	denotes a fixed-point number
<code><l></code>	denotes a (calc expression for a) length
<code><c></code>	denotes the name of a defined color
<code><cm></code>	denotes a valid color model name (in the sense of the color package)
<code><cd></code>	denotes a valid color definition (in the sense of the color package) wrt a given <code><cm></code> parameter
<code><t></code>	denotes a ‘truth value’ in the sense of the <code>ifthen</code> package: either true or false. As usual for <code>keyval</code> , if = <code><t></code> is omitted, the default true is assumed.

Parameter	Meaning
<code>stripes=<n></code>	Set the <code><stripes></code> parameter of gradient rules to <code><n></code> . Default: <code>\bgndstripes</code> Used by: <code>vgradient</code> , <code>hgradient</code> , <code>doublevgradient</code> , <code>doublehgradient</code>
<code>gradmidpoint=<r></code>	Set the <code><midpoint></code> parameter of double gradient rules to <code><r></code> . Default: <code>\bgndgradmidpoint</code> Used by: <code>doublevgradient</code> , <code>doublehgradient</code>
<code>firstgradprogression=<i></code>	Set the first gradient progression of gradient rules to <code><i></code> . Default: <code>\bgndfirstgradprogression</code> Used by: <code>vgradient</code> , <code>hgradient</code> , <code>doublevgradient</code> , <code>doublehgradient</code>

<code>secondgradprogression=<i></code>	Set the second gradient progression of double gradient rules to <code><i></code> . Default: <code>\bgndsecondgradprogression</code> Used by: doublevgradient, doublehgradient
<code>startcolor=<c></code>	Set the <code><startcolor></code> parameter of gradient rules to <code><c></code> . Default: If neither startcolor nor startcolordef is given, the color bgnstartcolor is used as <code><startcolor></code> . Used by: vgradient, hgradient, doublevgradient, doublehgradient Overwrites: startcolordef
<code>startcolordef={<cm>}{<cd>}</code>	Set the <code><startcolor></code> parameter of gradient rules to color foo, which is obtained by <code>\definecolor{foo}{<cm>}{<cd>}</code> . Note that the two pairs of curly braces are mandatory. Default: If neither startcolor nor startcolordef is given, the color bgnstartcolor is used as <code><startcolor></code> . Used by: vgradient, hgradient, doublevgradient, doublehgradient Overwrites: startcolordef
<code>endcolor=<c></code>	Set the <code><endcolor></code> parameter of gradient rules to <code><c></code> . Default: If neither endcolor nor endcolordef is given, the color bgnendcolor is used as <code><endcolor></code> . Used by: vgradient, hgradient, doublevgradient, doublehgradient Overwrites: endcolordef
<code>endcolordef={<cm>}{<cd>}</code>	Set the <code><endcolor></code> parameter of gradient rules to color foo, which is obtained by <code>\definecolor{foo}{<cm>}{<cd>}</code> . Note that the two pairs of curly braces are mandatory. Default: If neither endcolor nor endcolordef is given, the color bgnendcolor is used as <code><endcolor></code> . Used by: vgradient, hgradient, doublevgradient, doublehgradient Overwrites: endcolordef
<code>midcolor=<c></code>	Set the <code><midcolor></code> parameter of double gradient rules to <code><c></code> . Default: If neither midcolor nor midcolordef is given, the color bgndmidcolor is used as <code><midcolor></code> . Used by: doublevgradient, doublehgradient Overwrites: midcolordef

<code>midcolordef={<cm>}{<cd>}</code>	Set the <code><midcolor></code> parameter of double gradient rules to color <code>foo</code> , which is obtained by <code>\definecolor{foo}{<cm>}{<cd>}</code> . Note that the two pairs of curly braces are mandatory. Default: If neither <code>midcolor</code> nor <code>midcolordef</code> is given, the color <code>bgndmidcolor</code> is used as <code><midcolor></code> . Used by: <code>doublevgradient</code> , <code>doublehgradient</code> Overwrites: <code>midcolor</code>
<code>hpanels=<t></code>	Specifies the ‘direction’ of panels produced. <code>hpanels=true</code> means the top and bottom panel span the full width of the screen. In the space left in the middle, the left panel, the background itself, and the right panel are displayed. <code>hpanels=false</code> means the left and right panel span the full height of the screen. In the space left in the middle, the top panel, the background itself, and the bottom panel are displayed. Default: <code>hpanels=true</code> is the default for plain, <code>hgradient</code> and <code>doublehgradient</code> . <code>hpanels=false</code> is the default for <code>vgradient</code> and <code>doublevgradient</code> . Used by: plain, <code>vgradient</code> , <code>hgradient</code> , <code>doublevgradient</code> , <code>doublehgradient</code>
<code>autopanels=<t></code>	Specifies whether the default values of the parameters <code>toppanelheight</code> , <code>bottompanelheight</code> , <code>leftpanelwidth</code> , <code>rightpanelwidth</code> should be calculated automatically from the contents of declared panels. The automatism used is analogous to that of <code>\DeclarePanel*</code> . Note that for panel arrangement, both the width and the height of all declared panels are overwritten. If you don’t want this, calculate the panel parameters yourself and set <code>autopanels=false</code> . In this case, the current panel dimensions of declared panels are used as defaults for <code>toppanelheight</code> , <code>bottompanelheight</code> , <code>leftpanelwidth</code> , <code>rightpanelwidth</code> . Default: <code>true</code> . Used by: plain, <code>vgradient</code> , <code>hgradient</code> , <code>doublevgradient</code> , <code>doublehgradient</code>
<code>toppanelheight=<l></code> <code>bottompanelheight=<l></code> <code>leftpanelwidth=<l></code>	

```
rightpanelwidth=<l>
```

Set the height/width of the space left for the top/bottom/left/right panel to $\text{\j}\text{\l}$. Note that the remaining dimensions of panels, for instance the width of the top panel, are always calculated automatically, depending on the setting of the `hpansels` parameter. Default: If a respective panel has been defined using `\DeclarePanel`, the default used depends on the setting of the `autopanels` parameter. If `autopanels=true`, the correct dimension is calculated from the contents of the panel. The respective one of `\toppanelheight`, `\bottompanelheight`, `\leftpanelwidth`, `\rightpanelwidth` is overwritten with the result. If `autopanels=false`, then the respective setting of `\toppanelheight`, `\bottompanelheight`, `\leftpanelwidth`, `\rightpanelwidth` is taken as the default. If a panel has not been declared, the appropriate one of `\bgndtoppanelheight`, `\bgndbottompanelheight`, `\bgndleftpanelwidth`, `\bgndrightpanelwidth` is used as default. Used by: plain, vgradient, hgradient, doublevgradient, doublehgradient

```
toppanelcolor=<c>
bottompanelcolor=<c>
leftpanelcolor=<c>
rightpanelcolor=<c>
```

Set the color of the space left for the top/bottom/left/right panel to $\text{\j}\text{\c}\text{\l}$. Default: The standard colors `toppanelcolor`, `bottompanelcolor`, `leftpanelcolor`, `rightpanelcolor` are used as defaults. Used by: plain, vgradient, hgradient, doublevgradient, doublehgradient Overwrites: `toppanelcolordef` `bottompanelcolordef` `leftpanelcolordef` `rightpanelcolordef`

```
toppanelcolordef={<cm>}{<cd>}
bottompanelcolordef={<cm>}{<cd>}
leftpanelcolordef={<cm>}{<cd>}
```

rightpanelcolordef={<cm>}{{<cd>}} Set the color of the space left for the top/bottom/left/right panel to color foo, which is obtained by `\definecolor{foo}{<cm>}{{<cd>}}`. Note that the two pairs of curly braces are mandatory. Default: See the description of top/bottom/left/rightpanelcolor. Used by: plain, vgradient, hgradient, doublevgradient, doublehgradient Overwrites: toppanelcolor bottompanelcolor leftpanelcolor rightpanelcolor

```

```

Initialize the internal parameters to the values of the parameters.

The panel dimensions depend on other parameters set directly, defaults are calculated automatically.

Execute the style-specific command which follows.

Background-specific default values.

Default number of stripes for gradient page backgrounds.

```
1385 \newcommand{\bgndstripes}{10}
```

Default position of the ‘middle’ color of a double gradient.

```
1386 \newcommand{\bgndgradmidpoint}{.5}
```

Default gradient progression for page backgrounds (single gradients or first part of double gradients).

```
1387 \newcommand{\bgndfirstgradprogression}{1}
```

Default gradient progression for page backgrounds (second part of double gradients).

```
1388 \newcommand{\bgndsecondgradprogression}{1}
```

Default height/width of the space left for the top/bottom/left/right panel, in case no panel in the respective position has been declared. Otherwise, the defaults are taken from `\toppanelheight`, `\bottompanelheight`, `\leftpanelwidth`, `\rightpanelwidth` or calculated automatically, depending on the setting of the `autopanels` parameter. Note that the remaining dimensions of panels, for instance the width of the

top panel, are always calculated automatically, depending on the setting of the `hpanels` parameter.

3.5 Panels

The following code is rather preliminary and provides only the very basics for constructing panels. If you're using a document class or package which allows to do this or know how to achieve it using fancy headers, don't even consider using the following.

Some configurable panel parameters.

Margin around panels (space [on all sides] between beginning of background and panel contents).

```
1807 \mklength@TP{\panelmargin}{\fboxsep}
```

Dimensions of top panel. Note that parts or all of these dimensions might be overwritten by \DeclarePanel* or using \backgroundstyle with specific settings.

```
1808 \newcommand{\toppanelwidth}{\TPpagewidth}%
1809 \newcommand{\toppanelheight}{\TPpageheight/5}%
1810 \newcommand{\toppanelshift}{0pt}%
                                Space between left screen edge and left edge of
```

Dimensions of bottom panel.

```
1811 \newcommand{\bottompanelwidth}{\TPpagewidth}%
1812 \newcommand{\bottompanelheight}{\TPpageheight/5}%
1813 \newcommand{\bottompanelshift}{0pt}%
                                Space between left screen edge and left edge of
```

Dimensions of left panel.

```
1814 \newcommand{\leftpanelwidth}{\TPpagewidth/5}%
1815 \newcommand{\leftpanelheight}{\TPpageheight}%
1816 \newcommand{\leftpanelraise}{0pt}%
                                Space between bottom screen edge and bottom edge of
```

Dimensions of right panel.

```
1817 \newcommand{\rightpanelwidth}{\TPpagewidth/5}%
1818 \newcommand{\rightpanelheight}{\TPpageheight}%
1819 \newcommand{\rightpanelraise}{0pt}%
                                Space between bottom screen edge and bottom edge of
```

Some internal panel parameters.

Storage for panel contents.

```
1820 \newcommand*{\toppanelcontents@TP}{}%
1821 \newcommand*{\bottompanelcontents@TP}{}%
1822 \newcommand*{\leftpanelcontents@TP}{}%
1823 \newcommand*{\rightpanelcontents@TP}{}%
```

3.5.1 Panel-specific user level commands

\DeclarePanel \DeclarePanel[<name>]{<pos>}{<contents>} declares the contents <contents> of the panel at position <pos>. Afterwards, on every page the panel contents are set in a parbox of dimensions and position specified by <pos>panelwidth, <pos>panelheight, \panelmargin and <pos>panelsift for top and bottom panels and <pos>panelraise for left and right panels. The parbox is constructed anew on every page, so all changes influencing panel contents or parameters (like a \thepage in the panel contents) are respected.

The panel contents are set in color <pos>paneltextcolor. There is another standard color <pos>panelcolor, which is however not activated by \DeclarePanel but by selecting an appropriate background style. Note that pages are constructed as follows: first the page background, then the panels, and then the page contents. Hence, panels overwrite the background and the page contents overwrite the panels. The user is supposed to make sure themselves that there is enough space left on the page for the panels (document class specific settings). The panel declaration is global. A panel can be ‘undeclared’ by using \DeclarePanel{<pos>}{}

There is a starred version which will (try to) automatically calculate the ‘flexible’ dimension of each panel. For top and bottom panels this is the height, for left and right panels this is the width. Make sure the panel contents are ‘valid’ at the time \DeclarePanel* is called so the calculation can be carried out in a meaningful way. While the automatic calculation of the height of top and bottom panels is trivial (using \settoheight), there is a sophisticated procedure for calculating a ‘good’ width for the parbox containing the panel. Owing to limitations set by TeX, there are certain limits to the sophistication of the procedure. For instance, any ‘whatsits’ (specials (like color changes), file accesses (like \label), or hyper anchors) or rules which are inserted directly in the vertical list of the parbox ‘block’ the analysis, so the procedure can’t ‘see’ past them (starting at the bottom of the box) when analysing the contents of the parbox. The user should make sure such items are set in horizontal mode (by using \leavevmode or enclosing stuff in boxes). Furthermore, only overfull and underfull hboxes which occur while setting the parbox are considered when judging which width is ‘best’. This will reliably make the width large enough to contain ‘wide’ objects like tabulars, logos and buttons, but might not give optimal results for justified text. vboxes occurring directly in the vbox are ignored. Note further that hboxes with fixed width (made by \hbox to...) which occur directly in the vbox may disturb the procedure, because the fixed width cannot be recovered. These hboxes will be reformatted with the width of the vbox, generating an extremely large badness, unsettling the calculation of maximum badness. To avoid this such hboxes should be either contained in a vbox or set in horizontal mode with appropriate glue at the end.

If the optional argument *jname*; is given, the panel contents and (calculated) size will also be stored under the given name, to be restored later with \restorepanels. This is nice for switching between different sets of panels.

```
1824 \newcommand{\DeclarePanel}{\@ifstar\auto@declarepanel@TP\declarepanel@TP}
1825
1826 \newcommand{\declarepanel@TP}[3][]{%
1827   \expandafter\gdef\csname #2panelcontents@TP\endcsname{#3}%
1828   Just store panel contents.
```

1931 }
```

Calculate ‘best’ width of a parbox. The current algorithm will set the textual contents into parboxes of increasing width, starting from 0pt and ending with the maximum width given, in `\optwidthsteps` steps. The ‘badness’ of every parbox is measured. If it is below the threshold defined by `\optwidthlinetolerance`, the process is stopped and the found width accepted. If this doesn’t happen, the width of the parbox with the least badness is returned.

3.6 Navigation helpers

The following code is rather preliminary and provides only the very basics for making navigation buttons and such. If you're using a package which allows to do this, don't even consider using the following.

Some configurable button parameters.

Space between button label and border.

```
2085 \newcommand{\buttonsep}{\fboxsep}
```

Width of button frame.

```
2086 \newcommand{\buttonrule}{0pt}
```

Horizontal displacement of button shadow.

```
2087 \newcommand{\buttonshadowhshift}{.3\fboxsep}
```

Vertical displacement of button shadow.

```
2088 \newcommand{\buttonshadowvshift}{-.3\fboxsep}
```

Button-specific user level commands.

```
\button \button[<width>][<height>][<depth>][<alignment>]{<navcommand>}{<text>}
creates a button labelled <text> which executes <navcommand> when pressed.
<navcommand> can be for instance \Acrobatmenu{<command>} or \hyperlink{<target>}
(note that \navcommand{<command>} should take one (more) argument specifying the sensitive area which is provided by \button). If given, the optional parameters <width>, <height>, and <depth> give the width, height and depth, respectively, of the framed area comprising the button (excluding the shadow, but including the frame). Default are the 'real' width, height and depth, respectively, of <text>, plus allowance for the frame. If given, the optional parameter <alignment> (one of l,c,r) gives the alignment of <text> inside the button box (makes sense only if <width> is given).
```

```
2089 \newcommand{\button}[1][0pt]%
Collect first optional parameter.
```

```
2090 {%
```

```
2091  \mklength@TP\bt@width@TP{\#1}%

3.7 Set acrobat reader's page transition mode

Most of the following is snarfed from an email message of Marc van Dongen to the ppower4 mailing list on Thu, 7 Oct 1999. Thanks to Marc for his permission to include his code into this package.

\pagetransition \pagetransition{<setting>} is a generic command for setting the page transition with hyperref's \hypersetup. The command is defined to a noop in case hyperref is not loaded.

```
2201 \ifthenelse{\boolean{display}}%                                Are dynamic features enabled?

```

3.8 Set acrobat reader's automatic page advancing feature

`\pageDuration{<d>}` will force pages to be advanced automatically after `<d>` seconds when in full screen mode. The effect starts on the current page and is undone by a group end or the command `\stopAdvancing`. `<d>` should be a (fixed-point) number.

Note a very strange behaviour of acrobat and acroread v4.05 and onwards: Automatic advancing is disabled unless explicitly enabled by the “advance every `n` seconds” setting in the full screen dialogue. But in this case, all pages not having any page duration setting will be advanced after `<n>` seconds. As another trap, at least in some versions of acroread and acrobat, the maximum for `<n>` when set in the dialogue is 60 seconds. To make matters even worse, there seems to be a (quite arbitrary) even for duration setting of pages: 546 seconds (about nine minutes). This leaves you with the following options if you want to use automated advancing in your presentations (for animation effects, say):

1. You're using a version of acrobat or acroread 4.05 (or any other version where this misbehaviour miraculously isn't present): All is well, nothing to do.
2. You're using a ‘buggy’ version where more than 60 seconds can be set as a value for `<n>` in the full screen dialogue (I'm not sure whether such a beast

exists; maybe both ‘features’ coincide): Just activate automatic advancing in the full screen dialogue and set an ‘infinite’ number of seconds (3600, say). This value is masked by an explicit setting using `\pageDuration`, so animations will still work.

3. You’re using a ‘buggy’ version with a maximum dialogue setting of 60, but you’re comfortable with your presentation always advancing automatically at least every 60 seconds: Set `<n>` to 60 and proceed as above.
4. You’re using a ‘buggy’ version with a maximum dialogue setting of 60 and you’re comfortable with your presentation always advancing automatically at least every 546 seconds (9.1 minutes): Give the package option “nine-minutes” to `texpower`. This will put an explicit duration setting of 546 seconds on every page (overridden by explicit settings using `\pageDuration`). Set the advancing time in the full screen dialogue to anything; it will be ignored because every page has an explicit setting.
5. You’re using a ‘buggy’ version with a maximum dialogue setting of 60, you’d like your presentation to advance more slowly than every 546 seconds and your version of acroread or acrobat miraculously doesn’t have the upper bound of 546 seconds (which I’ve empirically discovered with acrobat 5.0 on Win NT): Put `\renewcommand{\infinitepageduration}{3600}` in your preamble and see what happens. If the value is too high, acroread will go into fast forward mode or do other strange things. Otherwise: Lucky you.
6. You’re using a ‘buggy’ version with a maximum dialogue setting of 60, you’d like your presentation to advance more slowly than every 546 seconds and your version of acroread or acrobat also has the upper bound of 546 seconds: In this case you’re out of luck. Of course you can try to get the guys at adobe to clean up this whole mess. Good luck with that!

If `\infinitepageduration` is set to empty, then a page duration setting will appear only where `\pageDuration` was used. Otherwise, every page without explicit setting gets a page duration of `\infinitepageduration`.

```
2254 \newcommand{\infinitepageduration}{}% Default: No page duration setting on every page
2255
2256 \ifthenelse{\boolean{nineminutes@TP}}% If the option ninemminutes is given, every page
2257 {\renewcommand{\infinitepageduration}{546}}% gets a setting of 546 seconds (9.1 minutes).

3.9 TeXPower kernel

This area contains the ‘low level’ implementation of TeXPowers central functions. Mainly, (La)TeX’s `\shipout` and `\output` routines are overloaded, adding some necessary functionality (duplication of page contents for incremental page building; display of backgrounds and panels). Also, the user command `\pause` is implemented here, using the kernel functions for saving and restoring page contents.

The code for overloading the output routine is derived from Klaus Guntermanns `texpause` package which can be obtained from the PPower4 Web site

<http://www-sp.iti.informatik.tu-darmstadt.de/software/ppower4/>

Thanks to Heiko Oberdiek for his suggestion how `\leaders` can be used to disable processing of whatsits in the duplicated text.

The code for overloading `\shipout` is derived from `everyshi.sty` with permission by Martin Schroeder.

3.9.1 Overload `\shipout`

Overloading is done at the beginning of the document just in case some other package messes with `\shipout`.

```

2289 \AtBeginDocument{\shipoutinit@TP}%
2290 Replace \shipout by own definition.
2291 \newcommand*{\shipoutinit@TP}%
2292 {\let\o@shipout@TP=\shipout% Memorize previous definition.
2293 \let\shipout\shipout@TP% Replace by own one.
2294 }%

```

Our own version of `\shipout` takes the offered box and passes it to another routine for further inspection.

```

2295 \newcommand{\shipout@TP}%
2296 {%
2297   \afterassignment\shipout@test@TP

```

```

2298 \global\setbox\@cclv= %
2299 }%

```

If `\shipout` is called with an argument of the form `\box<n>`, then the box will have indeed been assigned to `\@cclv` at the time `\shipout@test@TP` is called. In this case, `\shipout@output@TP` is called immediately. If `\shipout` is called with an argument of the form `\vbox{...}`, then `\shipout@test@TP` is called at the beginning of the box definition, **before** the box is assigned (this is a feature of `\afterassignment`). In this case, the call of `\shipout@output@TP` is moved **after** the box definition using `\afetrgroup`, so that `\@cclv` is correctly defined at the time `\shipout@output@TP` is executed.

```

2300 \newcommand{\shipout@test@TP}{%
2301 }%
2302 \ifvoid\@cclv\relax% Is the box assigned yet?
2303   \aftergroup\shipout@output@TP% No; defer execution of \shipout@output@TP.
2304 \else
2305   \shipout@output@TP% Yes; execute \shipout@output@TP immediately.
2306 \fi%
2307 }%

```

The main part of our redefinition of `\shipout`.

```

2308 \newcommand{\shipout@output@TP}{%
2309 }%
2310 \shipout@hook@TP% Here, our own stuff is executed, manipulating \@cclv.
2311 \o@shipout@TP\box\@cclv% Execute original shipout routine.
2312 }%

```

3.9.2 The kernel functions to be executed at `\shipout`

`\AtShipout{<code>}` will save `<code>` in a special place where it is executed at the time of the next `\shipout` (and then deleted). Needless to say it should not produce any output. This is mainly for placing anchors in a controlled way even inside incremental builds.

```
2313 \newcommand{\AtShipout}[1]
```

```
2314 {\expandafter\gdef\expandafter\at@shipout@once@TP\expandafter{\at@shipout@once@TP#1}}% Add arg
```

The container for `<code>` stored away by `\AtShipout`. This is placed on the page by the next `\shipout` and then deleted.

```
2315 \newcommand{\at@shipout@once@TP}{}%
```

Save the original definition of `\hyper@anchor`.

```
2316 \AtBeginDocument{\global\let\o@hyper@anchor\hyper@anchor}
```

The following makes sure that a hyper target `firstpage.<n>` is placed on the **first** subpage of every page.

```
2317 \@ifpackage{hyperref}{}% Is hyperref loaded?
2318 }% Yes. Prepare hook.
```

```
2319 \newcommand{\do@insert@firstanchor@TP}{% This is executed on the first subpage
2320 {\hypertarget{firstpage.\number\currentpagevalue}{}% Create target.
2321 }%
2322 {\newcommand{\do@insert@firstanchor@TP}{}% No. Leave hook empty.
```

This is executed on every subpage which is **not** the first one.

```
2323 \newcommand{\dont@insert@firstanchor@TP}{}%
```

This is the hook itself which is executed on every page.

```
2324 \newcommand{\insert@firstanchor@TP}{\do@insert@firstanchor@TP}%
```

The hook executed at every call of `\shipout`. It executes the following tasks:

1. Filter out whatsits on duplicate pages.
2. Put page background at the ‘lowest’ layer.
3. Put panels at the ‘second lowest’ layer.
4. Execute `\AtShipout` code and place hypertarget `firstpage.<n>`.
5. Put `\box@cclv` at ‘top’ layer.

```
2325 \newcommand{\shipout@hook@TP}{%
2326 {%
2327   \filterpage@TP%                               Filter out whatsits on duplicate pages.

3.9.3 Implementation of ‘fixcolorstack’ option

The problem is this: dvips (and some other tools) maintains a color stack when converting dvi to ps. Its function is to always be able to correctly switch back to the previously used color even if there is a page break (and according typesetting of headers etc) inbetween switching to another color and switching back. This has many advantages (pdftex, for instance, which doesn’t maintain a color stack, always has problems to restore the correct text color after a page break). In connection with TeXPower, however, this leads to problems. For controlling the color stack, push and pop commands are inserted into the dvi using specials. At typesetting time, these specials are stored in the vertical list. When page contents are copied, it might be that the copy contains an unequal number of push and pop commands, which will make dvips’s color stack go out of sync. To remedy this, texpower maintains a ‘counter stack’ which should contain all color stack commands issued on the current page. Whenever a copied page is shipped out, appropriate color stack correction commands are issued to balance the stack. As this is necessary only for drivers implementing a color stack, the option is disabled for some drivers.

```

2431              \expandafter\remove@resetcolor@TP\set@color
2432              \def\pushcolorname@TP#1%
2433              {%
2434                \begingroup \escapechar\m@ne\xdef\@gtempa{\string#1}\endgroup% Get the coded token
2435                \expandafter\pushcolor@TP\expandafter{\@gtempa}% ... and execute push
2436              }%

```

Pray to god all drivers will support the following hacks...

Save ‘original’ definition of `\set@color`. Our redefinition of `\reset@color` needs to know which color is being reset, so we add this as an argument. As it would be inconvenient to add a lot of tokens with `\aftergroup`, we wrap everything in a control sequence.

```

2421            \expandafter\def\expandafter\o@set@color@TP\expandafter%
2422            {%
2423              \set@color%
2424              \expandafter\aftergroup\csname\current@color\endcsname%
2425            }%
2426            \let\o@reset@color@TP=\reset@color% Save original definition
2427            \def\remove@resetcolor@TP#1\aftergroup\reset@color%
2428              {\def\pushcolor@TP##1{{\def\current@color{##1}#1}}}% This is the 'real' original
2429              %
2430              \expandafter\remove@resetcolor@TP\set@color
2431              \def\pushcolorname@TP#1%
2432              {%
2433                \begingroup \escapechar\m@ne\xdef\@gtempa{\string#1}\endgroup% Get the coded token
2434                \expandafter\pushcolor@TP\expandafter{\@gtempa}% ... and execute push
2435              }%

```

We need one command to ‘just push’ a color on the stack. Pushing is done by `\set@color` in a driver-specific way. But `\set@color` also creates an instance of `\reset@color` using `\aftergroup`. This instance is gobbled by this hack, hopefully leaving only the driver-specific code to push a color. Of course, this will break spectacularly if `\set@color` doesn’t have the form `{<do something>} \aftergroup \reset@color`.

```

2428            \def\remove@resetcolor@TP#1\aftergroup\reset@color%
2429              {\def\pushcolor@TP##1{{\def\current@color{##1}#1}}}% This is the 'real' original
2430              %
2431              \expandafter\remove@resetcolor@TP\set@color
2432              \def\pushcolorname@TP#1%
2433              {%
2434                \begingroup \escapechar\m@ne\xdef\@gtempa{\string#1}\endgroup% Get the coded token
2435                \expandafter\pushcolor@TP\expandafter{\@gtempa}% ... and execute push
2436              }%

```

Our own definition of `\set@color` adds a `\reset@color` command for the color just set to `\colorcorrections@TP`.

```

2437      \def\set@color%
2438      {%

3.9.4 Kernel functions for overloading `\output`

This is the ‘inner kernel’ which lies behind all dynamic effects.

Some user level parameters.

This flag can be evaluated at `\output` (resp. `\shipout`) time and tells whether the page being shipped out is a duplicate page.

```
2470 \newif\ifshippingduplicate
```

The command used to shipout a duplicate page.

```
2471 \providecommand{\TPeject}{\newpage}
```

Some internal registers to store away things.

Contents of the page so far. These have to be duplicated on every subpage.

```
2472 \newbox\mempageconts@TP
```

Footnotes on the page being duplicated. These have to be duplicated also.

```
2473 \newinsert\memfootins@TP
```

Original definition of output routine.

```
2474 \newtoks\memoutput@TP
      Save current page contents to a box.
      Which counters are to be restored to their original value after \pause?

```

3.9.6 Implementation of \pause

\pause ends the current paragraph, ships out the current page, starts a new page and copies whatever was on the current page onto the new page, where typesetting is resumed. This will create the effect of a ‘pause’ in the presentation, i.e. the presentation stops because the current page ends at the point where the \pause command occurred and is resumed at this point when the presenter switches to the next page.

```

2578 \providecommand\pause% If pause.sty is loaded, the existing definition of \pause is not overw
2579 {%
2580   \save@TP% Save contents of the page...
2581   \insertfirstduplicate@TP% ... and insert again.

2586       \insertsecondduplicate@TP% Restore counters (page number).
2587     }%
2588   {}%
2589 }%

```

3.9.7 Implementing \stepwise and all functions surrounding it

General usage: \stepwise{<contents>}

As of itself, \stepwise doesn’t do very much. If <contents> contains one or more constructs of the form \step{<stepcontents>}, the following happens:

1. The current paragraph is ended.
2. The current contents of the page are saved (as with `\pause`).
3. As many pages as there are `\step` commands in `<contents>` are produced. Every page starts with what was on the current page when `\stepwise` started. The first page also contains everything in `<contents>` which is not in `<stepcontents>` for any `\step` command. The second page additionally contains the `<stepcontents>` for the first `\step` command, and so on, until all `<stepcontents>` are displayed.
4. When all `<stepcontents>` are displayed, `\stepwise` ends and typesetting is resumed (still on the current page).

This will create the effect that the `\step` commands are executed ‘step by step’.

For a more detailed description of `\stepwise`, `\step` and their options, see below.

Most of the registers, macros and environments defined in the following are part of the user interface, so no @s.

3.9.8 Command administration

```
2590 \newcommand{\@onlyinstepwise@TP}[1]
2591 {%
2592   \providecommand#1%
2593   {%
2594     \PackageError{texpower}%
2595     {Command \string#1 can be used only inside \string\stepwise}%
2596     {%
2597       Commands like \string\step, \string\switch,
2598       \string\multistep\space or \string\overlays\MessageBreak
2599       can be used only inside the argument of a \string\stepwise\space variant.%
2600     }%
2601   }%
2602 }
```

3.9.9 Registers

The total number of `\step` commands occurring in `<contents>`.

```
2603 \newcounter{totalsteps}
```

The number at which the counter step starts counting. Can be set in the optional argument of `\stepwise`.

```
2604 \newcounter{firststep}
```

The number of the step currently being performed.

```
2605 \newcounter{step}
```

The number of the current `\step` command (only useful inside `<stepcontents>`).

```
2606 \newcounter{stepcommand}
```

The total number of `\step` commands which have been activated so far (this can differ from `\value{step}` if the order of `\step` commands is changed via the optional argument of `\step`).

```
2607 \newcounter{stepsperformed}
```

Is this `\step` command currently active for the first time? (only useful inside `<stepcontents>`).

```
2608 \newboolean{firstactivation}
```

Is this `\step` command currently active? (only useful inside `<stepcontents>`).

```
2609 \newboolean{active}
```

3.9.10 Custom commands for displaying step contents

Some of them are selected by the switches `\boxedsteps` and `\nonboxedsteps`.

Display `<stepcontents>` in a box.

```
2610 \newcommand{\displayboxed}{
```

```
2611 {%
```

```
2612   \ifmmode                                % We need to distinguish between math and
```

```
2613     \expandafter\mathpalette\expandafter\math@db@TP % In math mode, the style has to be respe
```

```
2614   \else
```

```
2615     \expandafter\text@db@TP
```

```
2616   \fi
```

```
2617 }
```

```
2618 \newcommand{\text@db@TP}[1]{\mbox{#1}}          % In text mode, we just use an \mbox.
```

```
2619 \newcommand{\math@db@TP}[2]{\mbox{$\math@th{#1}#2$}} % In math mode, the style (#1) is inserted b
```

Display `<stepcontents>` ‘as is’.

```
2620 \let\displayidentical=\@iden
```

3.9.11 Custom commands for ‘hiding’ stepcontents at the time the corresponding `\step` is not active.

Hiding stuff is not as easy as it seems... Often, it is desirable that an appropriate amount of ‘space’ is left where something is hidden, in case something visible follows or the hidden stuff is part of an alignment structure. Even if this is not the case, completely ignoring hidden text containing further `\step`'s can disturb the accounting of `\stepwise`, because `\step` numbers become unaligned. On the other hand, a lot of things which might be hidden (solitary &'s if the hidden text is part of an alignment structure, for instance) execute an implicit group closing and don't like it at all to be enclosed in boxes, for instance. Because of these conflicting constraints, several methods for hiding content are provided. It is up to the user to select the one most appropriate for each type of content, or to use the suggestions below as inspiration for own definitions.

Hide `<stepcontents>`, but display an appropriate amount of white space in the form of an appropriately dimensioned, empty box.

```
2621 \newcommand{\hidephantom}[1]
```

```
2622 {%
```

```
2623   {%
2624     \leavevmode\phantom{#1}%
```

`\phantom` normally produces an `\hbox`. `\leavevmode` makes it behave like `\mbox`.

```
2625   }%
2626 }
```

Ignore `<stepcontents>` completely.

```
2627 \newcommand{\hideignore}[1]{}
```

Sometimes, ignoring `<stepcontents>` completely can lead to confusion of `\stepwise`'s accounting when `<stepcontents>` contains further `\step` commands. `\hidesmartignore` produces no output, but executes `<stepcontents>` (in a box). Note that this will lead to errors if for instance `<stepcontents>` contains a tabular character & from an alignment structure.

```
2628 \newcommand{\hidesmartignore}[1]{\setbox\tempbox@TP=\vbox{#1}}
```

The command `\hidetext` makes its argument ‘invisible’, but without putting it into a box, thus preserving line breaks. `\hidetext` needs the soul package to work. If it is not loaded, `\hidetext` is defined to be equal to `\hideboxed`. Because of restrictions implied by the soul package, `\hidetext` is quite picky about the ‘regularity’ of its argument. That is, a lot of things will break when in the argument of `\hidetext`. See the documentation of the soul package for hints how to prevent this.

To allow soul to be loaded after texpower, we use `\AtBeginDocument`.

```
2629 \AtBeginDocument%
2630 {%
2631   \@ifpackageloaded{soul}{%
2632     \ifpackagelater{soul}{2002/05/28}{%
2633       \DeclareRobustCommand*\hidetext{%
```

To prevent `\phantom` from inserting an hbox into the vertical list.

```
2634   \leavevmode
2635   \SOUL@setup
```

Make current token ‘invisible’.

```
2636   \def\SOUL@everytoken{\phantom{\the\SOUL@token\SOUL@setkern\SOUL@charkern}}%
2637   \def\SOUL@everyhyphen{%
2638     {%
2639       \discretionary
2640       {%
2641         \unkern
```

2676   \newcommand{\hidetextcolor}[1]{\textcolor{\vanishcolor}{\vanishcolor{#1}}}
2677 }%
2678 \let\hidetextcolor=\hidephantom
2679 }
```

3.9.12 Displaying and hiding of step contents

The displaying and hiding of `<stepcontents>` is controlled by the commands `\displaystepcontents` and `\hidestepcontents`. The following switches define these to be either the boxed or the ‘as is’ versions defined above.

```
2680 \newcommand{\boxedsteps}          % Use boxed versions.
2681 {\let\displaystepcontents=\displayboxed\let\hidestepcontents=\hidephantom}
2682
2683 \newcommand{\nonboxedsteps}        % Use nonboxed versions.
2684 {\let\displaystepcontents=\displayidentical\let\hidestepcontents=\hideignore}
```

The default is to use the nonboxed versions. This can be changed in the optional argument of `\stepwise`.

```
2685 \nonboxedsteps
```

There is another command named `\activestep` which controls what happens when a `\step` command is activated for the first time. This is defined to do nothing by default.

```

2686 \let\activestep=\displayidentical
      The length \highlightboxsep gives the width of the frame around the box
      created by \highlightboxed.
2687 \newlength{\highlightboxsep}
2688 \setlength{\highlightboxsep}{.5\fboxsep}
      \highlightboxed{<text>} puts <text> into an \mbox with coloured back-
      ground if the colorhighlight option is set, and into an \fbox otherwise. As this
      is meant as an interpretation of \activestep, it is made sure that the result-
      ing box has the same dimensions as the argument (the outer frame may overlap
      surrounding text).

      \highlighttext is the counterpart of \highlightboxed for arbitrary text. It
      puts its argument on a colored background without putting it into a box (i.e.
      line breaks and hyphenation still work) if the colorhighlight option is set, and
      underlines otherwise. As this is meant as an interpretation of \activestep,
      it is made sure that the resulting text has the same dimensions as the argument
      (the outer frame may overlap surrounding text). \highlighttext needs the soul

```

package to work. If it is not loaded, `\highlighttext` is defined to do nothing. Because of restrictions implied by the soul package, `\highlighttext` is quite picky about the ‘regularity’ of its argument. That is, a lot of things will break when in the argument of `\highlighttext`. See the documentation of the soul package for hints how to prevent this.

To allow soul to be loaded after texpower, we use `\AtBeginDocument`.

3.9.13 Implementation of \step, \switch and relatives

\step takes two optional arguments for influencing the mode of activation, like this:

\step[<activatefirst>] [<whenactive>]{<stepcontents>}

Both <activatefirst> and <whenactive> should be conditions in the syntax of the \ifthenelse command.

<activatefirst> checks whether this \step is to be activated for the first time. The default value is \value{step}=\value{stepcommand}. By using \value{step}=<n>, this \step can be forced to appear as the n'th one.

<whenactive> checks whether this \step is to be considered active at all. The default behaviour is to check whether this \step has been activated before (this is saved internally for every step).

Both optional arguments allow two syntactical forms:

1. enclosed in square brackets [...] like explained above.
2. enclosed in braces (...). In this case, <activatefirst> and <whenactive> are not treated as conditions in the sense of \ifthenelse, but as conditionals like those used internally by L^AT_EX. That means, <activatefirst> (when enclosed in braces) can contain arbitrary T_EXcode which then takes two arguments and expands to one of them, depending on whether the condition is fulfilled or not fulfilled. For instance, \step[<activatefirst>]{<stepcontents>} could be replaced by \step(\ifthenelse{<activatefirst>}){<stepcontents>}.

Internally, the default for the treatment of <whenactive> is (\if@first@TP@true), where \if@first@TP@true is an internal condition checking whether this \step has been activated before.

If you wish to give the second optional argument but not the first, just write \step[] [<whenactive>] ...

There are the following variants of \step. In all cases, the treatment of optional arguments for controlling activation are the same as for \step:

\bstep[<activatefirst>] [<whenactive>]{<stepcontents>} Like \step, but is always boxed.

\switch[<activatefirst>] [<whenactive>]{<from>}{<to>} Instead of hiding and displaying <stepcontents>, switch from <from> to <to>.

\vstep[<activatefirst>] [<whenactive>] Doesn't take an argument, but switches to 'invisible' color.

`\dstep[<activatefirst>] [<whenactive>]` Doesn't take an argument, but switches to dimmed colors.

`\steponce[<activatefirst>]{<stepcontents>}` Like `\step`, but goes inactive again in the subsequent step.

The following variants act like their counterparts, but appear at the same time as the previous `\step` (or variant).

```
\restep[<activatefirst>] [<whenactive>]{<stepcontents>}
\rebstep[<activatefirst>] [<whenactive>]{<stepcontents>}
\reswitch[<activatefirst>] [<whenactive>]{<from>}{<to>}
\revstep[<activatefirst>] [<whenactive>]
\redstep[<activatefirst>] [<whenactive>]
```

Optional argument handling.

`\pickup@s@optargs@TP` reads the optional arguments of `\step` (or `\switch`, or relatives) and then calls `\@do@s@TP`.

```

\multistep*[<activatefirst>]{<n>}{<stepcontents>} is a shorthand macro for executing several steps successively. In fact, it would better be called \multiswitch, because its functionality is based on \switch, it only acts like a (simplified) \step command which is executed ‘several times’. \multistep[<activatefirst>]{<n>}{<stepcontents>} expands to a sequence of <n> commands of the form \switch[<activatefirst>][\boolean{firstactivation}]<stepcontents> with the effect that <stepcontents> is executed <n> times at different iterations of \stepwise. Note that [<activatefirst>] can also have the form (<activatefirst>), as usual for \switch. Because of the second optional argument [\boolean{firstactivation}], only one instance of <stepcontents> is displayed at a time. Inside <stepcontents>, a counter substep can be evaluated which tells the number of the current instance. In the starred form, the optional argument [\boolean{firstactivation}] is left out for the very last instance, so the last instance of <stepcontents> stays visible.

New counter for the number of the current substep.

3.9.14 Implementation of \stepwise

Every variant of \stepwise takes an optional argument, like this

\stepwise[<settings>]{<contents>}

<settings> will be placed right before the internal loop which produces the sequence of pages. It can contain settings of parameters which modify the behaviour of \stepwise or \step. <settings> is placed inside a group so all changes are local to this call of \stepwise.

Usually, the first page of a sequence produced contains only material which is not part of any <stepcontents>. The first <stepcontents> are displayed on the second page of the sequence.

For special effects, it might be desirable to have the first <stepcontents> active even on the first page of the sequence.

All variants of \stepwise have a starred version (e.g. \stepwise*) which does exactly that.

When \stepwise is executed, for every page of the sequence generated, <contents> is wrapped in the environment stepcapsule (but not grouped by default). This is empty by default for minimum intrusion. Redefine stepcapsule in the optional argument of \stepwise to change this (as is done for instance by \liststepwise).

```
3160 \newenvironment{stepcapsule}{}{}
```

Because \step commands usually occur deep in some nested structure, it is difficult to set local parameters (like page transitions) only for certain steps (local settings executed in <stepcontents> would be undone by closing groups).

\afterstep{<setting>} has the effect that <setting> will be performed **after** the current execution of <contents>, right before the page break for this page of the sequence generated.

```

3161 \newcommand{\afterstep}[1]
3162 {%
3163   \gdef\@afterstep@TP{#1}% The argument is simply stored in \@afterstep@TP, which is executed
3164 }

```

One new counter for saving the value of firststep.

```
3165 \newcounter{o@fs@TP}
```

```

\stepwise user interface.

3166 \newcommand{\stepwise}
3167 {%
3168   \global\c@o@fs@TP=\c@firststep\relax% Save the default value of counter firststep.
3169   \@ifstar% Using the starred version?
3170   {%
3171     \c@firststep=1\relax% Start with counter step at number 1.
3172     \stepwise@TP% Collect optional argument and proceed.
3173   }%
3174   {%
3175     \stepwise@TP% Use the default.
3176   }% End of \ifstar.
3177 }%

```

Sometimes, it might happen that vertical spacing is different on every page of a sequence generated by `\stepwise`, making lines ‘wobble’. There are two custom versions `\liststepwise`, `\parstepwise` of `\stepwise` which produce better vertical spacing by putting an invisible rule before `<contents>`. This will almost certainly lead to ‘consistent’ spacing which might nevertheless be different from the spacing if `\liststepwise` wasn’t present.

`\liststepwise{<contents>}` works exactly like `\stepwise`, but `<contents>` is delimited by a rule of height zero. Use for list environments and aligned equations.

`\parstepwise{<contents>}` works like `\liststepwise`, but `\boxedsteps` is turned on by default. Use for texts where steps are to be filled into blank spaces.

Command to activate special stepcapsule for `\liststepwise`.

```

3178 \newcommand{\list@stepcapsule}
3179 {%
3180   \renewenvironment{stepcapsule}{% stepcapsule is to put an invisible rule o

Save the current contents of the page.  
Save the values of all counters.  
Make a copy of all color definitions.  
A group makes redefinitions local.  
Set indicator.  
By default, \step executes \proper@step@TP.  
By default, \switch executes \proper@switch@TP.
```

One big problem with math is that `\mathchoice` typesets its argument four times. If `\step` commands are inside the argument of `\mathchoice`, counters (which are advanced globally by `\step`) go astray. So far, I don't know any remedy for this apart from (locally) hacking `\mathchoice`. I know this is a very fragile and non-recommended method, but it works for the examples and will hopefully do until someone helps me find a better solution.

```
3273 \let\orig@mathchoice@TP=\mathchoice% Save the current definition of \mathchoice...
3274 \def\mathchoice##1##2##3##4% ... and redefine.

3.9.16 Input system-specific settings

If file exists.

```
3403 \InputIfFileExists{tpsettings.cfg}{}{}
```

Change History

v0.0.1	General: First pre-alpha version . . .	2	v0.0.5	General: Fixed some problems with incompatible versions of hyperref (spotted by Marc van Dongen). (Apr 14: this code no longer exists)	2
v0.0.2	General: Squashing a bug...	2	v0.0.6	General: Added papersize settings. (Mar 28: these are now in fixseminar.sty)	2
v0.0.3	General: Tidying up command syntax; adding some in-line documentation.	2	v0.0.7	General: Removed dependency on hyperref; added support for	
v0.0.4	General: In-line documentation for the first pre-alpha version completed.	2			

	color emphasis; respect the display option; now loading tpsettings.cfg and tpoptions.cfg; added \bstep, \switch, \rebstep, \reswitch.	2	v0.0.8b	which disables \pageDuration if the pdffageduration key doesn't exist (spotted by Friedrich Eisenbrand). 2
v0.0.7a	General: \pause and \stepwise now use \leaders for inserting duplicated parts of pages. This way, processing of what-sits is turned off in the duplicates so that table of contents entries are no longer duplicated when a section occurs on a page where \pause or \stepwise is used (spotted by heiner richter). Thanks to Heiko Oberdiek for his suggestion how \leaders can be successfully applied for this purpose. \stepwise now does the right thing if no \step command occurs in contents. There was a bug in \save@TP which would become apparent if \stepwise was the first thing on a page. Spotted and fixed by Ross Moore (thanks). 2		General: Added additional 'dimmed' and 'enhanced' color sets for all standard colors, with corresponding commands \dimcolors and \enhancecolors. Added a 'color stack correction' option fixcolorstack, which should avoid that the duplication of "color push" and "color pop" specials confuses the driver's color stack (spotted by Ross Moore). Added new display commands \hidetext, \hidevansh, \highlighted. Added \step variants \dstep and \vstep. Added patches for \L, equation, eqnarray, and eqnarray* when the colormath option is used. Now also saving and restoring footnotes at \pause and \stepwise. Added a command \releasecounter to keep a counter from 'freezing' during the execution of \stepwise. . . 2	
v0.0.7b	General: Changed hyperref version check from 2000/03/22 to 2000/03/23. Spotted by Ross Moore.	2	v0.0.8c	General: The default duplication method will now (only) attack \protected@write. There's a new option hackwrite which restores the former default method (of attacking \write). Corrected a bug newly introduced into \switch with version 0.0.8b. Corrected a bug in the color correction code (spotted by Ross Moore). 2
v0.0.7c	General: \eject changed to \newpage in \stepwise to cure some problems with the foils package. Spotted by Ross Moore. 2		v0.0.8d	General: Corrected a minor quirk in \hidetext. Added a command \addTPcolor for defining new 'standard' colors. In print-out versions, the last step will no longer think it's 'first activated'. 2
v0.0.7d	General: \everydisplay finally removed from colormath option because it only causes trouble. Maybe I should look for a less fragile solution for the whole thing. Fixed a bug in texpower's definition of \set@page@color (used only if pdftex.def doesn't define it) which would cause a fatal error if two \pagecolor commands occur. Added command \replacecolor.	2	v0.0.8e	General: Yet another rewrite of the page duplication code. I
v0.0.8a	General: Fixed a bug in the code			

hope it's perfect this time :)	
The options robustduplicates	
and hackwrite are obsolete now.	
Thanks to Martin Schroeder	
for permission to use his ev-	
eryshi code. Fixed a small	
quirk in <code>\dstep</code> and <code>\vstep</code> .	
<code>\darkbackground</code> and relatives	
now set both page and text	
color.	2
v0.0.8f	
General: A small change in the def-	
inition of <code>\liststepwise</code> to en-	
hance vertical spacing.	2
v0.0.8g	
General: Color management ex-	
tended and largely rewritten. A	
small change to make page transi-	
tion and page duration set-	
tings local to groups. <code>\dstep</code>	
and <code>\vstep</code> now understand the	
usual optional arguments.	2
v0.0.9	
General: Added support for struc-	
tured backgrounds (command	
<code>\backgroundstyle</code>). New com-	
mands for gradient rules and	
boxes. Added a hack to keep	
hyperref from producing dupli-	
cate page anchors (suggested by	
Thomas Emmel). Some slight	
changes in the mode of account-	
ing in <code>\step</code> to hopefully give	
better results for ‘complicated’	
orders of activating steps us-	
ing <code>\step</code> ’s optional arguments.	
Added (experimental) com-	
mands <code>\multistep</code> and <code>\movie</code>	
for aiding in (simple) anima-	
tions. <code>\pagecolor</code> hack re-	
moved, as pdftex.def on CTAN	
now supports <code>\pagecolor</code> .	
<code>\set@color</code> hack for seminar	
removed (made unnecessary	
by enhancements to powersem).	
Added rudimentary support	
for panels. Added rudimen-	
tary support for navigation ele-	
ments. Now put a hyper anchor	
“firstpage.n” on the first ele-	
ment of the sequence for page	
n.	2
v0.0.9a	
General: Tidying up the inline doc-	
umentation. When the color	
package is loaded before tex-	
power, texpower’s color man-	
agement is no longer activated	
automatically. Definitions of	
standard colors moved to file	
tpcolors.cfg. Option ‘slifonts’	
is obsolete now. The code is	
now part of the much more	
sophisticated package “tpsli-	
fants”. Now the ‘colormath’ op-	
tion cooperates with array.sty	
(and thus colortbl.sty). New	
option “nineminutes” to cir-	
cumvent a strange behaviour	
of acrobat/acroread v4.05 and	
later wrt. page duration. Op-	
tion ‘fixcolorstack’ now checks	
also for VTeX. <code>\hidedimmed</code> ,	
<code>\highlightenhanced</code> and	
<code>\dstep</code> now check for math	
mode. Now using ifpdf pack-	
age if available.	2
v0.0.9b	
General: colormath adapted to dif-	
ferent handling of ‘equation’	
by amsmath 2.x. Adapted	
for new version of soul pack-	
age. Added another patch to	
colormath for handling array	
package’s “m” columns without	
color change. ‘Turn on’ semi-	
nar parameters in panel boxes	
even before <code>\begin{document}</code> .	
Added a command <code>\overlays</code> ,	
sibling of <code>\multistep</code> , which	
prints all steps over each other.	
Added a command <code>\steponce</code> ,	
sibling of <code>\step</code> , which is active	
only for one step. Removed a	
bug in color correction code in-	
roduced in v0.0.8g.	2
v0.0.9c	
General: A small fix to give	
<code>\overlays</code> a width. <code>\mklength</code>	
is now a user command.	
The <code>\nobreak</code> switch and	
<code>\everypar</code> are now saved	
and restored by <code>\stepwise</code> ,	
hopefully enhancing coop-	
eration with section head-	
ings and list environments.	
Changed <code>\newcommand</code> to	
<code>\providetcommand</code> to allow	

background.sty to be loaded in parallel (thanks to Hans Fr. Nordhaug for the original patch).	2	ter with LaTeX. Made <code>\step-</code> like commands give better er- ror messages when outside <code>\stepwise</code>	2
v0.0.9d		v0.1b	
General: Release.	2	General: Moved to dtx format. No other code changes.	2
v0.1		v0.2	
General: Removed font stuff (now resides in tpslifonts). A small fix to avoid warnings about ex- tremely overfull hboxes when measuring steps. Our dabbling with <code>\shipout</code> created display errors with some packages like pdfscreen. Thanks to Maarten Fokkinga for spotting it. Fixed.	2	General: Fixed bugs #1029803 and #1073319 reported at Source- Forge. Made the handling of whatsits smarter (making write to file and hyperref commands) stepwise-aware. Added op- tion/command to turn on/off the old aggressive/robust filter- ing. Added fragilesteps environ- ment.	2
v0.1a			
General: Color management ex- tended a little to integrate bet-
