CDO User's Guide

Climate Data Operators
Version 1.0.0
June 2006

Uwe Schulzweida

Max-Planck-Institute for Meteorology

Contents

1. Introduction

The Climate Data Operators (**CDO**) software is a collection of many operators for standard processing of climate and forecast model output. The operators include simple statistical and arithmetic functions, data selection and subsampling tools, and spatial interpolation. **CDO** was developed to have the same set of processing functions for GRIB and netCDF datasets in one package.

The Climate Data Interface (CDI) is used for the fast and file format independent access to GRIB and netCDF datasets. The local data formats SERVICE, EXTRA and IEG are also supported.

There are some limitations for GRIB and netCDF datasets. A GRIB dataset must be consistent, similar to netCDF. That means all time steps must have the same variables, and within a time step each variable may occur only once. NetCDF datasets are supported only with 2-dimensional, 3-dimensional and 4-dimensional variables and the attributes should follow the GDT, COARDS or CF Conventions.

The user interface and some operators are similar to the PINGO package. There are also some operators with the same name as in PINGO but with a different meaning. Appendix A gives an overview of those operators.

The main **CDO** features are:

- More than 250 operators available
- Modular design and easily extendable with new operators
- Very simple UNIX command line interface
- A dataset can be processed by several operators, without storing the interim results in files
- All operators handle datasets with missing values
- Fast processing of large datasets
- Support of many different grid types
- Tested on many UNIX/Linux systems, Cygwin, and MacOS-X

1.1. Building from sources

This section describes how to build **CDO** from the sources on a UNIX system. **CDO** uses the GNU configure and build system to compile the source code. The only requirement is a working ANSI C compiler.

First go to the `download` page (`http://www.mpimet.mpg.de/cdo`) to get the latest distribution, if you do not already have it.

To take full advantage of **CDO** features the following additional library should be installed.

- Unidata netCDF library (`http://www.unidata.ucar.edu/packages/netcdf/index.html`) version 3 or higher. This is needed to read/write netCDF files with **CDO**.

1.1.1. Compilation

Compilation is now done by performing the following steps:

1. Unpack the archive, if you haven't already done that:

```
gunzip cdo-$VERSION.tar.gz    # uncompress the archive
tar xf cdo-$VERSION.tar       # unpack it
cd cdo-$VERSION
```

2. Run the configure script:

```
./configure
```

   Or with netCDF support:

```
./configure --with-netcdf=<netCDF root directory>
```

   For an overview of other configuration options use

```
./configure --help
```

3. Compile the program by running make:

```
make
```

The program should compile without problems and the binary (`cdo`) should be available in the `src` directory of the distribution.

1.1.2. Installation

After the compilation of the source code do a `make install`, possibly as root if the destination permissions require that.

```
make install
```

The binary is installed into the directory <`prefix`>`/bin`. <`prefix`> defaults to `/usr/local` but can be changed with the `--prefix` option of the configure script.

Alternatively, you can also copy the binary from the `src` directory manually to some `bin` directory in your search path.

1.2. Usage

This section descibes how to use **CDO**. The syntax is:

```
cdo  [Options]  [Operators]
```

1.2.1. Options

All options must be pleaced before the first operator. The following options are available for all operators:

-a Convert from a relative to an absolute time axis.

-f <format> Set the output file format. The valid file formats are:

File format	*<format>*
GRIB version 1	`grb`
netCDF	`nc`
netCDF version 2	`nc2`
SERVICE	`srv`
EXTRA	`ext`
IEG	`ieg`

-g <grid> Define the default grid description by name or from file.
Available grid names are: `t`<RES>`grid`, `r`<NX>`x`<NY>, `gme`<NI>

-h Help information for the operators.

-m <missval> Set the default missing value (default: `-9e+33`).

-p <prec> Set the precision of the output data in bytes. The valid precisions depends on the file format:

<format>	*<prec>*
`grb`	`1/2/3`
`nc, nc2, srv, ext, ieg`	`4/8`

For `srv`, `ext` and `ieg` format a `L` or `B` can be added to set the byteorder to Little or Big endian.

-R Convert GRIB data from reduced to regular grid.

-r Convert from an absolute to a relative time axis.

-t <partab> Set the default parameter table name or file.
Predefined tables are: `echam4 echam5 mpiom1`

-V Print the version number.

-v Print extra details for some operators.

1.2.2. Operators

There are more than 250 operators available. A detailed description of all operators can be found in the **Reference Manual** section.

1.2.3. Combining operators

All operators with one output stream can pipe the result directly to an other operator. The operator must begin with "-", in order to combine it with others. This can improve the performance by:

- reducing unnecessary disk I/O
- parallel processing

Use

```
cdo sub -dayavg ifile2 -timavg ifile1 ofile
```

instead of

```
cdo timavg ifile1 tmp1
cdo dayavg ifile2 tmp2
cdo sub tmp2 tmp1 ofile
rm tmp1 tmp2
```

1.2.4. Operator parameter

Some operators need one or more parameter.

- STRING

  Unquoted characters without blanks and tabs. The following command select variables with the names `pressure` and `tsurf`:

  ```
  cdo selvar,pressure,tsurf ifile ofile
  ```

- FLOAT

  Floating point number in any representation. The following command sets the range between `0` and `273.15` of all fields to missing value:

  ```
  cdo setrtomiss,0,273.15 ifile ofile
  ```

- INTEGER

  A list of integers can be specified by *first/last[/inc]*. To select the days 5, 6, 7, 8 and 9 use:

  ```
  cdo selday,5/9 ifile ofile
  ```

  This is the same as:

  ```
  cdo selday,5,6,7,8,9 ifile ofile
  ```

1.3. Grid description

In the following situations it is necessary to give a description of a horizontal grid:

- Changing the grid description (operator: setgrid)
- Horizontal interpolation (operator: interpolate, remapXXX and genXXX)
- Generating variables (operator: const, random)

As now described, there are several possibilities to define a horizontal grid. Predefined grids are available for global regular, gaussian or icosahedral-hexagonal GME grids.

1.3.1. Predefined grids

The following pre-defined grid names are available: `r<NX>x<NY>`, `t<RES>grid` and `gme<NI>`

Global regular grid: `r<NX>x<NY>`

`r<NX>x<NY>` defines a global regular grid. The number of the longitutes `<NX>` and the latitudes `<NY>` can be selected at will. The longitudes starts at 0° with an increment of (360/`<NX>`)°. The latitudes go from south to north with an increment of (180/`<NY>`)°.

Global gaussian grid: `t<RES>grid`

`t<RES>grid` defines a global gaussian grid. Each valid triangular resolution can be used for `<RES>`. The longitudes starts at 0° with an increment of (360/nlon)°. The gaussian latitudes go from north to south.

Global icosahedral-hexagonal GME grid: `gme<NI>`

`gme<NI>` defines a global icosahedral-hexagonal GME grid. `NI` is the number of intervals on a main triangle side.

1.3.2. Grids from data files

You can use the grid description from an other datafile. The format of the datafile and the grid of the data field must be supported by this program. Use the operator 'sinfo' to get short informations about your variables and the grids. If there are more then one grid in the datafile the grid description of the first variable will be used.

1.3.3. SCRIP grids

SCRIP is a Spherical Coordinate Remapping and Interpolation Package. It is using a common grid description in netCDF. You can use it to describe curvilinear grids or unstructured grid cells. For more information about this format see [SCRIP]. This grid description format is only available if the program was compiled with netCDF support.

SCRIP grid description example of a curvilinear MPIOM1 GROB3 grid (only the netCDF header):

```
netcdf grob3s {
dimensions:
        grid_size = 12120 ;
        grid_xsize = 120 ;
        grid_ysize = 101 ;
        grid_corners = 4 ;
        grid_rank = 2 ;
variables:
        int grid_dims(grid_rank) ;
        float grid_center_lat(grid_ysize, grid_xsize) ;
                grid_center_lat:units = "degrees" ;
                grid_center_lat:bounds = "grid_corner_lat" ;
        float grid_center_lon(grid_ysize, grid_xsize) ;
                grid_center_lon:units = "degrees" ;
                grid_center_lon:bounds = "grid_corner_lon" ;
        int grid_imask(grid_ysize, grid_xsize) ;
                grid_imask:units = "unitless" ;
                grid_imask:coordinates = "grid_center_lon grid_center_lat" ;
        float grid_corner_lat(grid_ysize, grid_xsize, grid_corners) ;
                grid_corner_lat:units = "degrees" ;
        float grid_corner_lon(grid_ysize, grid_xsize, grid_corners) ;
                grid_corner_lon:units = "degrees" ;

// global attributes:
                :title = "grob3s" ;
}
```

1.3.4. PINGO grids

PINGO uses a very simple grid description in ASCII format to describe regular longitude/latitude or global gaussian grids. All PINGO grid description files are supported by **CDO**. For more information about this format see [PINGO].

PINGO grid description example of a T21 gaussian grid:

```
Grid Description File
(Comments start at non digit characters and end at end of line)
First part: The dimensions.
64 32 = Number of longitudes and latitudes
Second part: The listed longitudes.
2 means equidistant longitudes
```

```
0.000000 5.625000 = Most western and second most western longitude
Third part: The listed latitudes.
32 means all 32 latitudes are given in the following list:
 85.761  80.269  74.745  69.213  63.679  58.143  52.607  47.070
 41.532  35.995  30.458  24.920  19.382  13.844   8.307   2.769
 -2.769  -8.307 -13.844 -19.382 -24.920 -30.458 -35.995 -41.532
-47.070 -52.607 -58.143 -63.679 -69.213 -74.745 -80.269 -85.761
```

1.3.5. CDO grids

All supported grids can be also described with the **CDO** description ASCII formatted file. The following keywords can be used to describe a grid:

gridtype	STRING	type of the grid (gaussian, lonlat, curvilinear, cell)
gridsize	INTEGER	size of the grid
xsize	INTEGER	size in x direction (number of longitudes)
ysize	INTEGER	size in y direction (number of latitudes)
xvals	FLOAT ARRAY	x values of the grid
yvals	FLOAT ARRAY	y values of the grid
xnpole	FLOAT	x value of the north pole (rotated grid)
ynpole	FLOAT	y value of the north pole (rotated grid)
nvertex	INTEGER	number of the vertices for all grid cells
xbounds	FLOAT ARRAY	x bounds of each gridbox
ybounds	FLOAT ARRAY	y bounds of each gridbox
xfirst, xinc	FLOAT, FLOAT	macros to define xvals with a constant increment
yfirst, yinc	FLOAT, FLOAT	macros to define yvals with a constant increment

Which keywords are necessary depends on the gridtype. The following table gives an overview of the default values or the array size for the different grid types.

gridtype	lonlat	gaussian	curvilinear	cell
gridsize	xsize*ysize	xsize*ysize	xsize*ysize	**ncell**
xsize	**nlon**	**nlon**	**nlon**	gridsize
ysize	**nlat**	**nlat**	**nlat**	gridsize
xvals	xsize	xsize	gridsize	gridsize
yvals	ysize	ysize	gridsize	gridsize
xnpole	0			
ynpole	90			
nvertex	2	2	4	**nv**
xbounds	2*xsize	2*xsize	4*gridsize	nv*gridsize
ybounds	2*ysize	2*ysize	4*gridsize	nv*gridsize

The keywords nvertex, xbounds and ybounds are optional if the area weights are not needed.

CDO grid description example of a T21 gaussian grid:

```
gridtype = gaussian
xsize    = 64
ysize    = 32
xfirst   =  0
xinc     = 5.625
yvals    = 85.76  80.27  74.75  69.21  63.68  58.14  52.61  47.07
           41.53  36.00  30.46  24.92  19.38  13.84   8.31   2.77
           -2.77  -8.31 -13.84 -19.38 -24.92 -30.46 -36.00 -41.53
          -47.07 -52.61 -58.14 -63.68 -69.21 -74.75 -80.27 -85.76
```

CDO grid description example of a global regular grid with 60x30 points:

```
gridtype = lonlat
xsize    =   60
ysize    =   30
xfirst   = -177
xinc     =    6
yfirst   =  -87
yinc     =    6
```

For a lon/lat grid with an rotated pole, the north pole must be defined. As far as you define the keywords xnpole/ynpole all coordinate values are for the rotated system.

CDO grid description example of a regional rotated lon/lat grid:

```
gridtype = lonlat
xsize    = 81
ysize    = 91
xfirst   =  -19.5
xinc     =    0.5
yfirst   =  -25.0
yinc     =    0.5
xnpole   = -170
ynpole   =   32.5
```

Example **CDO** descriptions of a curvilinear and an unstructured grid can be found in Appendix B.

1.4. Time axis

A time axis describes the time for every timestep. Two time types are available: absolute time and relative time. **CDO** tries to maintain the actual type of the time axis for all operators. The operators for time range statistic (e.g.: monavg, ymonavg, ...) create an absolute time axis.

1.4.1. Absolute time

An absolute time axis has the current time to each time step. It can be used without knowledge of the calendar. This is preferably used by climate models. In netCDF files the relative time axis is represented by the unit of the time: "`day as %Y%m%d.%f`".

1.4.2. Relative time

A relative time is the time relative to a fixed reference time. The current time results from the reference time and the elapsed interval. The result depends on the calendar used. **CDO** supports the standard Gregorian, 360 days, 365 days and 366 days calendars. The relative time axis is preferably used by weather forecast models. In netCDF files the relative time axis is represented by the unit of the time: "*time-units* `since` *reference-time*", e.g "`days since 1989-6-15 12:00`".

1.4.3. Conversion of the time

Some programs which work with netCDF data can only process relative time axes. Therefore it may be necessary to convert from an absolute into a relative time axis. This conversion can be done for each operator with the **CDO** option '-r'. To convert a relative into an absolute time axis use the **CDO** option '-a'.

1.5. Parameter table

A parameter table is an ASCII formated file to convert code numbers to variable names. Each variable has one line with the code number, the name and the description with optional units in a blank separated list. It can be used only for GRIB, SERVICE, EXTRA and IEG formated files. The **CDO** option '-t <partab>' sets the default parameter table for all input files. Use the operator 'setpartab' to set the parameter table for a specific file.

Example of a **CDO** parameter table:

```
134  aps      surface pressure [Pa]
141  sn       snow depth [m]
147  ahfl     latent heat flux [W/m**2]
172  slm      land sea mask
175  albedo   surface albedo
211  siced    ice depth [m]
```

1.6. Missing values

All operators can handle missing values. The default missing value for GRIB, SERVICE, EXTRA and IEG files is $-9e+33$. The **CDO** option '-m <missval>' overwrites the default missing value. In netCDF files the variable attribute '_FillValue' is used as a missing value. The operator 'setmissval' can be used to set a new missing value.

The **CDO** use of the missing value is shown in the following tables, where one table is printed for each operation. The operations are applied to arbitrary numbers a, b, the special case 0, and the missing value $miss$. For example the table named "addition" shows that the sum of an arbitrary number a and the missing value is the missing value, and the table named "multiplication" shows that 0 multiplied by missing value results in 0.

addition	**b**	**miss**
a	$a+b$	$miss$
miss	$miss$	$miss$

subtraction	**b**	**miss**
a	$a-b$	$miss$
miss	$miss$	$miss$

multiplication	**b**	**0**	**miss**
a	$a*b$	0	$miss$
0	0	0	0
miss	$miss$	0	$miss$

division	**b**	**0**	**miss**
a	a/b	$miss$	$miss$
0	0	$miss$	$miss$
miss	$miss$	$miss$	$miss$

maximum	**b**	**miss**
a	$max(a,b)$	a
miss	b	$miss$

minimum	**b**	**miss**
a	$min(a,b)$	a
miss	b	$miss$

The handling of missing values by the operations "minimum" and "maximum" may be surprising, but the

definition given here is more consistent with that expected in practice. Mathematical functions (e.g. *log*, *sqrt*, etc.) return the missing value if an argument is the missing value or an argument is out of range.

All statistical functions ignore missing values, treading them as not belonging to the sample, with the side-effect of a reduced sample size.

1.6.1. Mean and average

An artificial distinction is made between the notions mean and average. The mean is regarded as a statistical function, whereas the average is found simply by adding the sample members and dividing the result by the sample size. For example, the mean of 1, 2, $miss$ and 3 is $(1 + 2 + 3)/3 = 2$, whereas the average is $(1 + 2 + miss + 3)/4 = miss/4 = miss$. If there are no missing values in the sample, the average and mean are identical.

2. Reference manual

This section gives a description of all operators. Similar operators are grouped to modules. For easier description all single input files are named `ifile` or `ifile1`, `ifile2`, etc., and an unlimited number of input files are named `ifiles`. All output files are named `ofile` or `ofile1`, `ofile2`, etc. Further the following notion is introduced:

$i(t)$	Timestep t of `ifile`
$i(t, x)$	Element number x of the field at timestep t of `ifile`
$o(t)$	Timestep t of `ofile`
$o(t, x)$	Element number x of the field at timestep t of `ofile`

2.1. Information

This section contains modules to print information about datasets. All operators print there results to standard output.

Here is a short overview of all operators in this section:

info	Dataset information listed by code number
infov	Dataset information listed by variable name
map	Dataset information and simple map
sinfo	Short dataset information listed by code number
sinfov	Short dataset information listed by variable name
diff	Compare two datasets listed by code number
diffv	Compare two datasets listed by variable name
ncode	Number of codes
nvar	Number of variables
nlevel	Number of levels
nyear	Number of years
nmon	Number of months
ndate	Number of dates
ntime	Number of time steps
showcode	Show codes
showvar	Show variable names
showlevel	Show levels
showyear	Show years
showmon	Show months
showdate	Show dates
showtime	Show time steps
vardes	Variable description
griddes	Grid description
vct	Vertical coordinate table

2.1.1. INFO - Information and simple statistics

Synopsis

<operator> `ifiles`

Description

This module writes information about the structure and contents of all input datasets to standard output. The information displayed depends on the actual operator.

Operators

info Dataset information listed by code number
Prints information and simple statistics for each field of all input datasets. For each field the operator prints one line with the following elements:

- Date and Time
- Code number and Level
- Size of the grid and number of Missing values
- Minimum, Mean and Maximum
  The mean value is computed without the use of area weights!

infov Dataset information listed by variable name
The same as operator info but using the name instead of the code number to identify the variables.

map Dataset information and simple map
Prints information, simple statistics and a map for each field of all input datasets. The map will be printed only for fields on a rectangular grid.

Example

To print information and simple statistics for each field of a dataset use:

```
cdo info ifile
```

This is an example result of a dataset with one 2D variable over 12 time steps:

```
   -1 :       Date   Time Code Level   Size   Miss :    Minimum     Mean  Maximum
    1 : 1987-01-31 12:00  139     0   2048   1361 :     232.77   266.65   305.31
    2 : 1987-02-28 12:00  139     0   2048   1361 :     233.64   267.11   307.15
    3 : 1987-03-31 12:00  139     0   2048   1361 :     225.31   267.52   307.67
    4 : 1987-04-30 12:00  139     0   2048   1361 :     215.68   268.65   310.47
    5 : 1987-05-31 12:00  139     0   2048   1361 :     215.78   271.53   312.49
    6 : 1987-06-30 12:00  139     0   2048   1361 :     212.89   272.80   314.18
    7 : 1987-07-31 12:00  139     0   2048   1361 :     209.52   274.29   316.34
    8 : 1987-08-31 12:00  139     0   2048   1361 :     210.48   274.41   315.83
    9 : 1987-09-30 12:00  139     0   2048   1361 :     210.48   272.37   312.86
   10 : 1987-10-31 12:00  139     0   2048   1361 :     219.46   270.53   309.51
   11 : 1987-11-30 12:00  139     0   2048   1361 :     230.98   269.85   308.61
   12 : 1987-12-31 12:00  139     0   2048   1361 :     241.25   269.94   309.27
```

2.1.2. SINFO - Short information

Synopsis

<operator> `ifile`

Description

This module writes information about the structure of all input datasets to standard output. The information displayed depends on the actual operator.

Operators

sinfo Short dataset information listed by code number
Prints short information of a dataset. The information is divided into 4 sections. Section 1 prints one line per variable with the following information:

- institute and source
- parameter table and code number
- horizontal grid size and number
- number of vertical levels and zaxis number

Section 2 and 3 gives a short overview of all horizontal and vertical grids. And the last section contains short information of the time axis.

sinfov Short dataset information listed by variable name
The same as operator sinfo but using the name instead of the code number and parameter table to identify the variables.

Example

To print short information of a dataset use:

```
cdo sinfo ifile
```

This is the result of an ECHAM5 dataset with 3 variables and 12 time steps:

```
  -1 : Institut Source   Table Code    Time   Typ  Grid Size Num  Levels Num
   1 : MPIMET   ECHAM5.3   128  129 constant R4       2048   1       1   1
   2 : MPIMET   ECHAM5.3   128  130 variable R4       2048   1       4   2
   3 : MPIMET   ECHAM5.3   128  139 variable R4       2048   1       1   1
Horizontal grids :
   1 : gaussian     > size      : dim = 2048  nlon = 64  nlat = 32
                      longitude : first = 0  last = 354.375  inc = 5.625
                      latitude  : first = 85.7605871  last = -85.7605871
Vertical grids :
   1 : surface                 : 0
   2 : pressure             Pa : 92500 85000 50000 20000

```

2.1.3. DIFF - Compare two datasets field by field

Synopsis

<operator> `ifile1 ifile2`

Description

Compares the contents of two datasets field by field. The input datasets must have the same structure and the fields must have the same header information and dimensions.

Operators

diff Compare two datasets listed by code number
Provides statistics on differences between two datasets. For each pair of fields the operator prints one line with the following information:

- date and time
- code number and level
- size of the grid and number of missing values
- occurrence of coefficient pairs with different signs
- occurrence of zero values
- maxima of absolute difference of coefficient pairs
- maxima of relative difference of non-zero coefficient pairs with equal signs

diffv Compare two datasets listed by variable name
The same as operator diff. Using the name instead of the code number to identify the variable.

Example

To print the difference for each field of two datasets use:

```
cdo diff ifile1 ifile2
```

This is an example result of the difference of two datasets with one 2D variable and 12 time steps:

```
                Date  Time Code Level  Size  Miss : S Z     Absdiff     Reldiff
   1 : 1987-01-31 12:00 139      0  2048  1361 : F F  0.00010681  4.1660e-07
   2 : 1987-02-28 12:00 139      0  2048  1361 : F F  6.1035e-05  2.3742e-07
   3 : 1987-03-31 12:00 139      0  2048  1361 : F F  7.6294e-05  3.3784e-07
   4 : 1987-04-30 12:00 139      0  2048  1361 : F F  7.6294e-05  3.5117e-07
   5 : 1987-05-31 12:00 139      0  2048  1361 : F F  0.00010681  4.0307e-07
   6 : 1987-06-30 12:00 139      0  2048  1361 : F F  0.00010681  4.2670e-07
   7 : 1987-07-31 12:00 139      0  2048  1361 : F F  9.1553e-05  3.5634e-07
   8 : 1987-08-31 12:00 139      0  2048  1361 : F F  7.6294e-05  2.8849e-07
   9 : 1987-09-30 12:00 139      0  2048  1361 : F F  7.6294e-05  3.6168e-07
  10 : 1987-10-31 12:00 139      0  2048  1361 : F F  9.1553e-05  3.5001e-07
  11 : 1987-11-30 12:00 139      0  2048  1361 : F F  6.1035e-05  2.3839e-07
  12 : 1987-12-31 12:00 139      0  2048  1361 : F F  9.3553e-05  3.7624e-07
```

2.1.4. NINFO - Print the number of variables, levels or times

Synopsis

<operator> `ifile`

Description

This module prints, according to the actual operator, the number of variables, levels or times of the input dataset.

Operators

ncode Number of codes
Prints the number of variables with different code numbers.

nvar Number of variables
Prints the number of variables with different names.

nlevel Number of levels
Prints the number of levels for each variable.

nyear Number of years
Prints the number of different years.

nmon Number of months
Prints the number of different combinations of years and months.

ndate Number of dates
Prints the number of different dates.

ntime Number of time steps
Prints the number of time steps.

Example

To print the number of variables in a dataset use:

```
cdo nvar ifile
```

To print the number of month in a dataset use:

```
cdo nmon ifile
```

2.1.5. SHOWINFO - Show variables, levels or times

Synopsis

<operator> `ifile`

Description

This module prints, according to the actual operator, the variables, levels or times of the input dataset.

Operators

showcode Show codes
Prints the code number of all different variables.

showvar Show variable names
Prints the name of all different variables.

showlevel Show levels
Prints all levels for each variable.

showyear Show years
Prints all different years.

showmon Show months
Prints all different months.

showdate Show dates
Prints all different dates.

showtime Show time steps
Prints all time steps.

Example

To print the code number of all variables in a dataset use:

```
cdo showcode ifile
```

This is an example result of a dataset with three variables:

```
129 130 139
```

To print all months in a dataset use:

```
cdo showmon ifile
```

This is an examples result of a dataset with an annual cycle:

```
1 2 3 4 5 6 7 8 9 10 11 12
```

2.1.6. FILEDES - Dataset description

Synopsis

<operator> `ifile`

Description

This module prints, according to the actual operator, the description of the variables, the grids or the vertical coordinate table.

Operators

vardes Variable description
Prints a table with a description of all variables. For each variable the operator prints one line listing the code, name, description and units.

griddes Grid description
Prints the description of all grids in a file.

vct Vertical coordinate table
Prints the vertical coordinate table.

Example

Assume an input dataset having three variables with the names geosp, t and tslm1. To print the description of these variables use:

```
cdo vardes ifile
```

Result:

```
129  geosp          surface geopotential (orography) [m^2/s^2]
130  t              temperature [K]
139  tslm1          surface temperature of land [K]
```

Assume all variables of the dataset are on a T21 gausssian grid. To print the grid description of this dataset use:

```
cdo griddes ifile
```

Result:

```
gridtype  : gaussian
gridsize  : 2048
xname     : lon
xlongname : longitude
xunits    : degrees_east
yname     : lat
ylongname : latitude
yunits    : degrees_north
xsize     : 64
ysize     : 32
xfirst    : 0
xinc      : 5.625
yvals     : 85.76058 80.26877 74.74454 69.21297 63.67863 58.1429 52.6065
            47.06964 41.53246 35.99507 30.4575 24.91992 19.38223 13.84448
            8.306702 2.768903 -2.768903 -8.306702 -13.84448 -19.38223
            -24.91992 -30.4575 -35.99507 -41.53246 -47.06964 -52.6065
            -58.1429 -63.67863 -69.21297 -74.74454 -80.26877 -85.76058
```

2.2. File operations

This section contains modules to perform operations on files.

Here is a short overview of all operators in this section:

copy	Copy datasets
cat	Concatenate datasets
replace	Replace variables
merge	Merge datasets with different fields
mergetime	Merge datasets sorted by date and time
splitcode	Split codes
splitvar	Split variables
splitlevel	Split levels
splitgrid	Split grids
splitzaxis	Split zaxis
splitrec	Split records
splithour	Split hours
splitday	Split days
splitmon	Split months
splitseas	Split seasons
splityear	Split years

2.2.1. COPY - Copy datasets

Synopsis

<operator> `ifiles ofile`

Description

This module contains operators to copy or concatenate datasets. Each input dataset must have the same variables with complete time steps.

Operators

copy Copy datasets
Copies all input datasets to `ofile`.

cat Concatenate datasets
Concatenates all input datasets and append the result to the end of `ofile`. If `ofile` does not exist it will be created.

Example

To change the format of a dataset to netCDF use:

```
cdo -f nc copy ifile ofile.nc
```

Add the option '-r' to create a relative time axis, as is required for proper recognition by GrADS or Ferret:

```
cdo -r -f nc copy ifile ofile.nc
```

To concatenate 3 datasets with different time steps of the same variables use:

```
cdo copy ifile1 ifile2 ifile3 ofile
```

If the output dataset already exist and you wish to extend it with more time steps use:

```
cdo cat ifile1 ifile2 ifile3 ofile
```

2.2.2. REPLACE - Replace variables

Synopsis

replace `ifile1 ifile2 ofile`

Description

Replaces all common variables of `ifile2` and `ifile1` with those of `ifile1` and write the result to `ofile`. Both input datasets must have the same number of time steps.

Example

Assume the first input dataset `ifile1` has three variables with the names geosp, t and tslm1 and the second input dataset `ifile2` has only the variable tslm1. To replace the variable tslm1 in `ifile1` with tslm1 from `ifile2` use:

```
cdo replace ifile1 ifile2 ofile
```

2.2.3. MERGE - Merge datasets

Synopsis

<*operator*> `ifiles ofile`

Description

This module reads datasets from several input files, merges them and writes the resulting dataset to `ofile`.

Operators

merge Merge datasets with different fields
Merges time series of different fields from several input datasets. The number of fields per time step written to `ofile` is the sum of the field numbers per time step in all input datasets. The time series on all input datasets must have different fields and the same number of time steps.

mergetime Merge datasets sorted by date and time
Merges all time steps of all input files sorted by date and time. After this operation every input time step is in `ofile` and all time steps are sorted by date and time. Each input file must have the same variables and different time steps.

Example

Assume three datasets with the same number of time steps and each dataset with different variables. To merge these datasets to a new dataset use:

```
cdo merge ifile1 ifile2 ifile3 ofile
```

Assume you have split a 6 hourly dataset with splithour. This produces four datasets one for each hours. The following command merges them together:

```
cdo mergetime ifile1 ifile2 ifile3 ifile4 ofile
```

2.2.4. SPLIT - Split a dataset

Synopsis

<operator> `ifile oprefix`

Description

This module splits a dataset to several files with names formed from the field header information and `oprefix`.

Operators

splitcode Split codes
Splits a dataset into pieces, one for each different code number. Appends three digits with the code number to `oprefix` to form the output file names.

splitvar Split variables
Splits a dataset into pieces, one for each variable name. Appends a string with the variable name to `oprefix` to form the output file names.

splitlevel Split levels
Splits a dataset into pieces, one for each different level. Appends six digits with the level to `oprefix` to form the output file names.

splitgrid Split grids
Splits a dataset into pieces, one for each different grid. Appends two digits with the grid number to `oprefix` to form the output file names.

splitzaxis Split zaxis
Splits a dataset into pieces, one for each different zaxis. Appends two digits with the zaxis number to `oprefix` to form the output file names.

splitrec Split records
Splits a dataset into pieces, one for each record. Appends six digits with the record number to `oprefix` to form the output file names.

Example

Assume an input GRIB dataset with three variables, e.g. code number 129, 130 and 139. To split this dataset into three pieces, one for each code number use:

```
cdo splitcode ifile code
```

Result of '`dir code*`':

```
code129.grb code130.grb code139.grb
```

2.2.5. SPLITTIME - Split time steps of a dataset

Synopsis

<operator> `ifile oprefix`

Description

This module splits time steps of a dataset to several files with names formed from the field header information and `oprefix`.

Operators

splithour Split hours
Splits a file into pieces, one for each different hour. Appends two digits with the hour to `oprefix` to form the output file names.

splitday Split days
Splits a file into pieces, one for each different day. Appends two digits with the day to `oprefix` to form the output file names.

splitmon Split months
Splits a file into pieces, one for each different month. Appends two digits with the month to `oprefix` to form the output file names.

splitseas Split seasons
Splits a file into pieces, one for each different season. Appends three characters with the season to `oprefix` to form the output file names.

splityear Split years
Splits a file into pieces, one for each different year. Appends four digits with the year to `oprefix` to form the output file names.

Example

Assume the input GRIB dataset has time steps from January to December. To split each month with all variables into one separate file use:

```
cdo splitmon ifile mon
```

Result of '`dir mon*`':

```
mon01.grb  mon02.grb  mon03.grb  mon04.grb  mon05.grb  mon06.grb
mon07.grb  mon08.grb  mon09.grb  mon10.grb  mon11.grb  mon12.grb
```

2.3. Selection

This section contains modules to select time steps, fields or part of a field from a dataset.

Here is a short overview of all operators in this section:

selcode	Select codes
delcode	Delete codes
selvar	Select variables
delvar	Delete variables
sellevel	Select levels
selgrid	Select grids
selgridname	Select grids by name
selzaxis	Select zaxes
selzaxisname	Select zaxes by name
seltabnum	Select parameter table numbers
selrec	Select records
seltimestep	Select time steps
seltime	Select times
selhour	Select hours
selday	Select days
selmon	Select months
selyear	Select years
selseas	Select seasons
seldate	Select dates
sellonlatbox	Select a longitude/latitude box
selindexbox	Select an index box

2.3.1. SELECT - Select fields

Synopsis

selcode,*codes* `ifile ofile`

delcode,*codes* `ifile ofile`

selvar,*vars* `ifile ofile`

delvar,*vars* `ifile ofile`

sellevel,*levels* `ifile ofile`

selgrid,*grids* `ifile ofile`

selgridname,*gridnames* `ifile ofile`

selzaxis,*zaxes* `ifile ofile`

selzaxisname,*zaxisnames* `ifile ofile`

seltabnum,*tabnums* `ifile ofile`

selrec,*records* `ifile ofile`

Description

This module selects some fields from `ifile` and writes them to `ofile`. The fields selected depend on the actual operator and the parameters.

Operators

selcode	Select codes Selects all fields with code numbers in a user given list.
delcode	Delete codes Deletes all fields with code numbers in a user given list.
selvar	Select variables Selects all fields with variable names in a user given list.
delvar	Delete variables Deletes all fields with variable names in a user given list.
sellevel	Select levels Selects all fields with levels in a user given list.
selgrid	Select grids Selects all fields with grids in a user given list.
selgridname	Select grids by name Selects all fields with grid names in a user given list.
selzaxis	Select zaxes Selects all fields with zaxes in a user given list.
selzaxisname	Select zaxes by name Selects all fields with zaxis names in a user given list.
seltabnum	Select parameter table numbers Selects all fields with parameter table numbers in a user given list.
selrec	Select records Selects all fields with record numbers in a user given list. This operator can not be used with netCDF data!

Parameter

codes	INTEGER	Comma separated list of code numbers
vars	STRING	Comma separated list of variable names
levels	FLOAT	Comma separated list of levels
grids	INTEGER	Comma separated list of grid numbers
gridnames	STRING	Comma separated list of grid names
zaxes	INTEGER	Comma separated list of zaxis numbers
zaxisnames	STRING	Comma separated list of zaxis names
tabnums	INTEGER	Comma separated list of parameter table numbers
records	INTEGER	Comma separated list of records

Example

Assume an input dataset has three variables with the code numbers 129, 130 and 139. To select the variables with the code number 129 and 139 use:

```
cdo selcode,129,139 ifile ofile
```

You can also select the code number 129 and 139 by deleting the code number 130 with:

```
cdo delcode,130 ifile ofile
```

2.3.2. SELTIME - Select time steps

Synopsis

seltimestep,*timesteps* `ifile ofile`

seltime,*times* `ifile ofile`

selhour,*hours* `ifile ofile`

selday,*days* `ifile ofile`

selmon,*months* `ifile ofile`

selyear,*years* `ifile ofile`

selseas,*seasons* `ifile ofile`

seldate,*date1[,date2]* `ifile ofile`

Description

This module selects user specified time steps from `ifile` and writes them to `ofile`. The time steps selected depend on the actual operator and the parameters.

Operators

seltimestep Select time steps
Selects all time steps with a time step in a user given list.

seltime Select times
Selects all time steps with a time in a user given list.

selhour Select hours
Selects all time steps with a hour in a user given list.

selday Select days
Selects all time steps with a day in a user given list.

selmon Select months
Selects all time steps with a month in a user given list.

selyear Select years
Selects all time steps with a year in a user given list.

selseas Select seasons
Selects all time steps with a month of a season in a user given list.

seldate Select dates
Selects all time steps with a date in a user given range.

Parameter

timesteps	INTEGER	Comma separated list of time steps
times	STRING	Comma separated list of times (format HH:MM)
hours	INTEGER	Comma separated list of hours
days	INTEGER	Comma separated list of days
months	INTEGER	Comma separated list of months
years	INTEGER	Comma separated list of years
seasons	STRING	Comma separated list of seasons (DJF, MAM, JJA, SON)
date1	STRING	Start date (format YYYY-MM-DD)
date2	STRING	End date (format YYYY-MM-DD)

2.3.3. SELBOX - Select a box of a field

Synopsis

sellonlatbox,*lon1*,*lon2*,*lat1*,*lat2* `ifile ofile`

selindexbox,*idx1*,*idx2*,*idy1*,*idy2* `ifile ofile`

Description

Selects a box of the rectangular understood field. All input fields must have the same horizontal grid.

Operators

sellonlatbox Select a longitude/latitude box
Selects a longitude/latitude box. The user has to give the longitudes and latitudes of the edges of the box.

selindexbox Select an index box
Selects an index box. The user has to give the indexes of the edges of the box. The index of the left edge may be greater then that of the right edge.

Parameter

lon1	FLOAT	Western longitude
lon2	FLOAT	Eastern longitude
lat1	FLOAT	Southern or northern latitude
lat2	FLOAT	Northern or southern latitude
idx1	INTEGER	Index of first longitude
idx2	INTEGER	Index of last longitude
idy1	INTEGER	Index of first latitude
idy2	INTEGER	Index of last latitude

Example

To select the region with the longitudes from 120E to 90W and latitudes from 20N to 20S from all input fields use:

```
cdo sellonlatbox,120,-90,20,-20 ifile ofile
```

If the input dataset has fields on a T21 gaussian grid, the same box can be selected with selindexbox by:

```
cdo selindexbox,23,48,13,20 ifile ofile
```

2.4. Conditional selection

This section contains modules to conditional select field elements. The fields in the first input file are handled as a mask. A value not equal to zero is treated as "true", zero is treated as "false".

Here is a short overview of all operators in this section:

ifthen	If then
ifnotthen	If not then
ifthenelse	If then else
ifthenc	If then constant
ifnotthenc	If not then constant

2.4.1. COND - Conditional select one field

Synopsis

<operator> `ifile1 ifile2 ofile`

Description

This module conditional selects field elements from `ifile2` and writes them to `ofile`. The fields in `ifile1` are handled as a mask. A value not equal to zero is treated as "true", zero is treated as "false".

Operators

ifthen If then

$$o(t,x) = \begin{cases} i_2(t,x) & \text{if } i_1(t,x) \neq 0 \quad \wedge \; i_1(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = 0 \quad \vee \; i_1(t,x) = \text{miss} \end{cases}$$

ifnotthen If not then

$$o(t,x) = \begin{cases} i_2(t,x) & \text{if } i_1(t,x) = 0 \quad \wedge \; i_1(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) \neq 0 \quad \vee \; i_1(t,x) = \text{miss} \end{cases}$$

Example

To select all field elements of `ifile2` if the corresponding field element of `ifile1` is greater than 0, use:

```
cdo ifthen ifile1 ifile2 ofile
```

2.4.2. COND2 - Conditional select two fields

Synopsis

ifthenelse `ifile1 ifile2 ifile3 ofile`

Description

This operator conditional selects field elements from `ifile2` or `ifile3` and writes them to `ofile`. The fields in `ifile1` are handled as a mask. A value not equal to zero is treated as "true", zero is treated as "false".

$$o(t,x) = \begin{cases} i_2(t,x) & \text{if } i_1(t,x) \neq 0 \quad \wedge \; i_1(t,x) \neq \text{miss} \\ i_3(t,x) & \text{if } i_1(t,x) = 0 \quad \wedge \; i_1(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \end{cases}$$

Example

To select all field elements of `ifile2` if the corresponding field element of `ifile1` is greater than 0 and from `ifile3` otherwise, use:

```
cdo ifthenelse ifile1 ifile2 ifile3 ofile
```

2.4.3. CONDC - Conditional select a constant

Synopsis

<operator>,*c* `ifile ofile`

Description

This module creates fields with a constant value or missing value. The fields in `ifile1` are handled as a mask. A value not equal to zero is treated as "true", zero is treated as "false".

Operators

ifthenc If then constant

$$o(t,x) = \begin{cases} \text{c} & \text{if } i(t,x) \neq 0 \quad \wedge \; i(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = 0 \quad \vee \; i(t,x) = \text{miss} \end{cases}$$

ifnotthenc If not then constant

$$o(t,x) = \begin{cases} \text{c} & \text{if } i(t,x) = 0 \quad \wedge \; i(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) \neq 0 \quad \vee \; i(t,x) = \text{miss} \end{cases}$$

Parameter

c FLOAT Constant

Example

To create fields with the constant value 7 if the corresponding field element of `ifile` is greater than 0, use:

```
cdo ifthenc,7 ifile ofile
```

2.5. Comparison

This section contains modules to compare datasets. The resulting field is a mask with 1 if the comparison is true and 0 if the comparison is false.

Here is a short overview of all operators in this section:

eq	Equal
ne	Not equal
le	Less equal
lt	Less than
ge	Greater equal
gt	Greater than
eqc	Equal constant
nec	Not equal constant
lec	Less equal constant
ltc	Less then constant
gec	Greater equal constant
gtc	Greater then constant

2.5.1. COMP - Comparison of two fields

Synopsis

<operator> `ifile1 ifile2 ofile`

Description

This module compares two datasets field by field. The resulting field is a mask with 1 if the comparison is true and 0 if the comparison is false. The type of the comparison depends on the actual operator.

Operators

eq Equal

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) = i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) \neq i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee\ i_2(t,x) = \text{miss} \end{cases}$$

ne Not equal

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) \neq i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) = i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee\ i_2(t,x) = \text{miss} \end{cases}$$

le Less equal

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) \leq i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) > i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee\ i_2(t,x) = \text{miss} \end{cases}$$

lt Less than

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) < i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) \geq i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee\ i_2(t,x) = \text{miss} \end{cases}$$

ge Greater equal

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) \geq i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) < i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee\ i_2(t,x) = \text{miss} \end{cases}$$

gt Greater than

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) > i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) \leq i_2(t,x) \quad \wedge\ i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee\ i_2(t,x) = \text{miss} \end{cases}$$

Example

To create a mask with 1 if the elements of two fields are the same and 0 if the elements are different, use:

```
cdo eq ifile1 ifile2 ofile
```

2.5.2. COMPC - Comparison of a field with a constant

Synopsis

<operator>,*c* `ifile ofile`

Description

This module compares all fields of dataset with a constant. The resulting field is a mask with 1 if the comparison is true and 0 if the comparison is false. The type of the comparison depends on the actual operator.

Operators

eqc Equal constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) = c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) \neq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

nec Not equal constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) \neq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) = c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

lec Less equal constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) \leq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) > c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

ltc Less then constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) < c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) \geq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

gec Greater equal constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) \geq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) < c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

gtc Greater then constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) > c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) \leq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

Parameter

c	FLOAT	Constant

Example

To create a mask with 1 if the field element is greater than 273.15 and 0 if not, use:

```
cdo gtc,273.15 ifile ofile
```

2.6. Modification

This section contains modules to modify the metadata, fields or part of a field in a dataset.

Here is a short overview of all operators in this section:

setpartab	Set parameter table
setcode	Set code number
setvar	Set variable name
setlevel	Set level
setdate	Set date
settime	Set time
setday	Set day
setmon	Set month
setyear	Set year
settunits	Set time units
settaxis	Set time axis
setreftime	Set reference time
setcalendar	Set calendar
shifttime	Shift time steps
chcode	Change code number
chvar	Change variable name
chlevel	Change level
chlevelc	Change level of one code
chlevelv	Change level of one variable
setgrid	Set grid
setgridtype	Set grid type
setzaxis	Set zaxis
setgatt	Set global attribute
setgatts	Set global attributes
invertlat	Invert latitude
invertlon	Invert longitude
invertlatdes	Invert latitude description
invertlondes	Invert longitude description
invertlatdata	Invert latitude data
invertlondata	Invert longitude data
masklonlatbox	Mask a longitude/latitude box
maskindexbox	Mask an index box
enlarge	Enlarge fields
setmissval	Set a new missing value
setctomiss	Set constant to missing value
setmisstoc	Set missing value to constant
setrtomiss	Set range to missing value

2.6.1. SET - Set field info

Synopsis

setpartab,*table* `ifile ofile`

setcode,*code* `ifile ofile`

setvar,*name* `ifile ofile`

setlevel,*level* `ifile ofile`

Description

This module sets some field information. Depending on the actual operator the parameter table, code number, variable name or level is set.

Operators

setpartab	Set parameter table Sets the parameter table for all variables.
setcode	Set code number Sets the code number for all variables to the same given value.
setvar	Set variable name Sets the name of the first variable.
setlevel	Set level Sets the first level of all variables.

Parameter

table	STRING	Parameter table file or name
code	INTEGER	Code number
name	STRING	Variable name
level	FLOAT	New level

Example

To assign the parameter table echam5 to the input dataset use:

```
cdo setpartab,echam5 ifile ofile
```

2.6.2. SETTIME - Set time

Synopsis

setdate,*date* `ifile ofile`

settime,*time* `ifile ofile`

setday,*day* `ifile ofile`

setmon,*month* `ifile ofile`

setyear,*year* `ifile ofile`

settunits,*units* `ifile ofile`

settaxis,*date*,*time*[,*inc*] `ifile ofile`

setreftime,*date*,*time* `ifile ofile`

setcalendar,*calendar* `ifile ofile`

shifttime,*sval* `ifile ofile`

Description

This module sets the time axis or part of the time axis. Which part of the time axis is overwritten depends on the actual operator.

Operators

setdate	Set date Sets the date in every time step to the same given value.
settime	Set time Sets the time in every time step to the same given value.
setday	Set day Sets the day in every time step to the same given value.
setmon	Set month Sets the month in every time step to the same given value.
setyear	Set year Sets the year in every time step to the same given value.
settunits	Set time units Sets the base units of a relative time axis.
settaxis	Set time axis Sets the time axis.
setreftime	Set reference time Sets the reference time of an relative time axis.
setcalendar	Set calendar Sets the calendar of an relative time axis.
shifttime	Shift time steps Shifts all time steps by the parameter sval.

Parameter

day	INTEGER	Value of the new day
month	INTEGER	Value of the new month
year	INTEGER	Value of the new year
units	STRING	Base units of the time axis (minutes, hours, days, months, years).
date	STRING	Date (format YYYY-MM-DD)
time	STRING	Time (format HH:MM)
inc	STRING	Optional increment (e.g. 12hour) [default: 0hour]
calendar	STRING	Calendar (standard, 360days, 365days, 366days)
sval	STRING	Shift value (e.g. -3hour)

Example

To set the time axis to 1987-01-16 12:00 with an increment of one month for each time step use:

```
cdo settaxis,1987-01-16,12:00,1mon ifile ofile
```

Result of '`cdo showdate ofile`' for a dataset with 12 timesteps:

```
1987-01-16 1987-02-16 1987-03-16 1987-04-16 1987-05-16 1987-06-16 \
1987-07-16 1987-08-16 1987-09-16 1987-10-16 1987-11-16 1987-12-16
```

To shift this time axis by -15 days use:

```
cdo shifttime,-15days ifile ofile
```

Result of '`cdo showdate ofile`':

```
1987-01-01 1987-02-01 1987-03-01 1987-04-01 1987-05-01 1987-06-01 \
1987-07-01 1987-08-01 1987-09-01 1987-10-01 1987-11-01 1987-12-01
```

2.6.3. CHANGE - Change field header

Synopsis

chcode,*oldcode,newcode[,...]* `ifile ofile`

chvar,*ovar,nvar,...* `ifile ofile`

chlevel,*oldlev,newlev,...* `ifile ofile`

chlevelc,*code,oldlev,newlev* `ifile ofile`

chlevelv,*var,oldlev,newlev* `ifile ofile`

Description

This module reads fields from `ifile`, changes some header values and writes the results to `ofile`. The kind of changes depends on the actual operator.

Operators

chcode	Change code number Changes some user given code numbers to new user given values.
chvar	Change variable name Changes some user given variable names to new user given names.
chlevel	Change level Changes some user given levels to new user given values.
chlevelc	Change level of one code Changes one level of a user given code number.
chlevelv	Change level of one variable Changes one level of a user given variable.

Parameter

code	INTEGER	Code number
oldcode,newcode,...	INTEGER	Pairs of old and new code numbers
var	STRING	Variable name
ovar,nvar,...	STRING	Pairs of old and new variable names
oldlev	FLOAT	Old level
newlev	FLOAT	New level
oldlev,newlev,...	FLOAT	Pairs of old and new levels

Example

To change the code number 98 to 179 and 99 to 211 use:

```
cdo chcode,98,179,99,211 ifile ofile
```

2.6.4. SETGRID - Set grid type

Synopsis

setgrid,*grid* `ifile ofile`

setgridtype,*gridtype* `ifile ofile`

Description

This module sets the grid description of all fields with the same grid size as the new grid.

Operators

setgrid	Set grid Sets the grid description of all fields.
setgridtype	Set grid type Sets the grid type of all grids to a user given value.

Parameter

grid	STRING	Target grid description file or name
gridtype	STRING	Target grid type (curvilinear or cell)

Example

Assumed a dataset has fields with 2048 gridpoints without or with wrong grid description. To set the grid description of all input fields to a T21 gaussian grid (2048 gridpoints) use:

```
cdo setgrid,t21grid ifile ofile
```

2.6.5. SETZAXIS - Set zaxis type

Synopsis

setzaxis,*zaxis* `ifile ofile`

Description

This operator sets the zaxis description of all variables with the same number of level as the new zaxis.

Parameter

zaxis	STRING	Zaxis description file or name of the target zaxis

2.6.6. SETGATT - Set global attribute

Synopsis

setgatt,*attname,attstring* `ifile ofile`

setgatts,*attfile* `ifile ofile`

Description

This module sets global text attributes of a dataset. Depending on the actual operator the attributes are read from a file or can be specified by a parameter.

Operators

setgatt Set global attribute
Sets one user defined global text attribute.

setgatts Set global attributes
Sets user defined global text attributes. The name and text of the global attributes are read from a file.

Parameter

attname,attstring	STRING	Name and text of the global attribute (without spaces!)
attfile	STRING	File name which contains global text attributes

Note

From the supported data formats only netCDF can work with global attributes.

Example

To set the global text attribute "myatt" to "myattcontents" in a netCDF file use:

```
cdo setgatt,myatt,myattcontents ifile ofile
```

Result of '`ncdump -h ofile`':

```
netcdf ofile {
dimensions: ...

variables: ...

// global attributes:
                :myatt = "myattcontens" ;
}
```

2.6.7. INVERT - Invert fields

Synopsis

<operator> `ifile ofile`

Description

This module inverts 2D fields on a rectangular grid. Depending on the actual operator the field, only the data or only the grid description is inverted.

Operators

invertlat	Invert latitude Inverts the latitude of a field.
invertlon	Invert longitude Inverts the longitude of a field.
invertlatdes	Invert latitude description Inverts only the latitude description of a field.
invertlondes	Invert longitude description Inverts only the longitude description of a field.
invertlatdata	Invert latitude data Inverts only the latitude data of a field.
invertlondata	Invert longitude data Inverts only the longitude data of a field.

Example

To invert the latitudes of a 2D field from N->S to S->N, use:

```
cdo invertlat ifile ofile
```

2.6.8. MASKBOX - Masks a box

Synopsis

masklonlatbox,*lon1*,*lon2*,*lat1*,*lat2* `ifile ofile`

maskindexbox,*idx1*,*idx2*,*idy1*,*idy2* `ifile ofile`

Description

Masks a box of the rectangular understood field. The elements inside the box are untouched, the elements outside are set to missing value. All input fields must have the same horizontal grid.

Operators

masklonlatbox Mask a longitude/latitude box
Masks a longitude/latitude box. The user has to give the longitudes and latitudes of the edges of the box.

maskindexbox Mask an index box
Masks an index box. The user has to give the indexes of the edges of the box. The index of the left edge may be greater then that of the right edge.

Parameter

lon1	FLOAT	Western longitude
lon2	FLOAT	Eastern longitude
lat1	FLOAT	Southern or northern latitude
lat2	FLOAT	Northern or southern latitude
idx1	INTEGER	Index of first longitude
idx2	INTEGER	Index of last longitude
idy1	INTEGER	Index of first latitude
idy2	INTEGER	Index of last latitude

Example

To mask the region with the longitudes from 120E to 90W and latitudes from 20N to 20S on all input fields use:

```
cdo masklonlatbox,120,-90,20,-20 ifile ofile
```

If the input dataset has fields on a T21 gaussian grid, the same box can be masked with maskindexbox by:

```
cdo maskindexbox,23,48,13,20 ifile ofile
```

2.6.9. ENLARGE - Enlarge fields

Synopsis

enlarge,*grid* `ifile ofile`

Description

Enlarge all fields of `ifile` to a user given grid. Normally only the last field element is used for the enlargement. If however the input and output grid are rectangular, a zonal or meridional enlargement is possible. Zonal enlargement takes place, if the xsize of the input field is 1 and the ysize of both grids are the same. For meridional enlargement the ysize must be 1 and the xsize of both grids must have the same size.

Parameter

grid	STRING	Target grid description file or name

Example

Assumed you want to add two datasets. The first dataset is on a T21 grid (2048 field elements) and the second dataset is only a global mean (1 field element). Before you can add these two datasets the second dataset must be enlarged to the grid size of the first dataset:

```
cdo enlarge,t21grid ifile2 tmpfile
cdo add ifile1 tmpfile ofile
```

Or shorter with pipes:

```
cdo add ifile1 -enlarge,t21grid ifile2 ofile
```

2.6.10. SETMISS - Set missing value

Synopsis

setmissval,*miss* `ifile ofile`

setctomiss,*c* `ifile ofile`

setmisstoc,*c* `ifile ofile`

setrtomiss,*rmin*,*rmax* `ifile ofile`

Description

This module sets part of a field to missing value or missing values to a constant value. Which part of the field is set depends on the actual operator.

Operators

setmissval Set a new missing value

$$o(t,x) = \begin{cases} \text{miss} & \text{if } i(t,x) = miss \\ i(t,x) & \text{if } i(t,x) \neq miss \end{cases}$$

setctomiss Set constant to missing value

$$o(t,x) = \begin{cases} \text{miss} & \text{if } i(t,x) = c \\ i(t,x) & \text{if } i(t,x) \neq c \end{cases}$$

setmisstoc Set missing value to constant

$$o(t,x) = \begin{cases} c & \text{if } i(t,x) = \text{miss} \\ i(t,x) & \text{if } i(t,x) \neq \text{miss} \end{cases}$$

setrtomiss Set range to missing value

$$o(t,x) = \begin{cases} \text{miss} & \text{if } i(t,x) \geq rmin \wedge i(t,x) \leq rmax \\ i(t,x) & \text{if } i(t,x) < rmin \vee i(t,x) > rmax \end{cases}$$

Parameter

miss	FLOAT	New missing value
c	FLOAT	Constant
rmin	FLOAT	Lower bound
rmax	FLOAT	Upper bound

Example

Assume an input dataset has one field with the temperature in the range from 246 to 304 Kelvin. To set all values below 273.15 Kelvin to missing value use:

```
cdo setrtomiss,0,273.15 ifile ofile
```

Result of '`cdo info ifile`':

```
   -1 :       Date   Time Code Level   Size   Miss :    Minimum     Mean  Maximum
    1 : 1987-12-31 12:00 139       0   2048      0 :     246.27   276.75   303.71
```

Result of '`cdo info ofile`':

```
   -1 :       Date   Time Code Level   Size   Miss :    Minimum     Mean  Maximum
    1 : 1987-12-31 12:00 139       0   2048    871 :     273.16   287.08   303.71
```

2.7. Arithmetic

This section contains modules to arithmetically process datasets.

Here is a short overview of all operators in this section:

expr	Evaluate expressions
exprf	Evaluate expressions from script file
abs	Absolute value
sqr	Square
sqrt	Square root
exp	Exponential
ln	Natural logarithm
log10	Base 10 logarithm
sin	Sine
cos	Cosine
tan	Tangent
asin	Arc sine
acos	Arc cosine
atan	Arc tangent
addc	Add a constant
subc	Subtract a constant
mulc	Multiply with a constant
divc	Divide by a constant
add	Add two fields
sub	Subtract two fields
mul	Multiply two fields
div	Divide two fields
min	Minimum of two fields
max	Maximum of two fields
atan2	Arc tangent of two fields
ymonadd	Add multi-year monthly time average
ymonsub	Subtract multi-year monthly time average
ymonmul	Multiply multi-year monthly time average
ymondiv	Divide multi-year monthly time average
muldpm	Multiply with days per month
divdpm	Divide by days per month
muldpy	Multiply with days per year
divdpy	Divide by days per year

2.7.1. EXPR - Evaluate expressions

Synopsis

expr,*instr* `ifile ofile`

exprf,*filename* `ifile ofile`

Description

This module arithmetically processes every time step of the input dataset. Each individual assignment statement must end with a semi-colon. The basic arithmetic operations addition +, subtraction −, multiplication ∗, division / and exponentiation ^ can be used. The following intrinsic functions are available:

sqrt(x)	Square Root of x
exp(x)	Exponential of x
log(x)	Natural logarithm of x
log10(x)	Base 10 logarithm of x
sin(x)	Sine of x, where x is specified in radians
cos(x)	Cosine of x, where x is specified in radians
tan(x)	Tangent of x, where x is specified in radians
asin(x)	Arc-sine of x, where x is specified in radians
acos(x)	Arc-cosine of x, where x is specified in radians
atan(x)	Arc-tangent of x, where x is specified in radians

Operators

expr	Evaluate expressions The processing instructions are read from the parameter.
exprf	Evaluate expressions from script file Contrary to expr the processing instructions are read from a file.

Parameter

instr	STRING	Processing instructions (without spaces!)
filename	STRING	File with processing instructions

Example

Assume an input dataset contains at least the variables 'aprl', 'aprc' and 'ts'. To create a new variable 'var1' with the sum of 'aprl' and 'aprc' and a variable 'var2' which convert the temperature 'ts' from Kelvin to Celsius use:

```
cdo expr,'var1=aprl+aprc;var2=ts-273.15;' ifile ofile
```

The same example, but the instructions are read from a file:

```
cdo exprf,myexpr ifile ofile
```

The file `myexpr` contains:

```
var1 = aprl + aprc;
var2 = ts - 273.15;
```

2.7.2. MATH - Mathematical functions

Synopsis

<operator> `ifile ofile`

Description

This module contains some standard mathematical functions. All trigonometric functions calculate with radians.

Operators

abs Absolute value
$o(t,x) = \mathrm{abs}(i(t,x))$

sqr Square
$o(t,x) = i(t,x)^2$

sqrt Square root
$o(t,x) = \sqrt{i(t,x)}$

exp Exponential
$o(t,x) = \mathrm{e}^{i(t,x)}$

ln Natural logarithm
$o(t,x) = \ln(i(t,x))$

log10 Base 10 logarithm
$o(t,x) = \log_{10}(i(t,x))$

sin Sine
$o(t,x) = \sin(i(t,x))$

cos Cosine
$o(t,x) = \cos(i(t,x))$

tan Tangent
$o(t,x) = \tan(i(t,x))$

asin Arc sine
$o(t,x) = \arcsin(i(t,x))$

acos Arc cosine
$o(t,x) = \arccos(i(t,x))$

atan Arc tangent
$o(t,x) = \arctan(i(t,x))$

Example

To calculate the square root for all field elements use:

```
cdo sqrt ifile ofile
```

2.7.3. ARITHC - Arithmetic with a constant

Synopsis

<operator>,*c* `ifile ofile`

Description

This module performs simple arithmetic with all field elements of a dataset and a constant. The header and date information in `ofile` is the same as in `ifile`.

Operators

addc Add a constant
$o(t,x) = i(t,x) + c$

subc Subtract a constant
$o(t,x) = i(t,x) - c$

mulc Multiply with a constant
$o(t,x) = i(t,x) * c$

divc Divide by a constant
$o(t,x) = i(t,x)/c$

Parameter

c	FLOAT	Constant

Example

To sum all input fields with the constant -273.15 use:

```
cdo addc,-273.15 ifile ofile
```

2.7.4. ARITH - Arithmetic on two datasets

Synopsis

<operator> `ifile1 ifile2 ofile`

Description

This module performs simple arithmetic of two datasets. The header and date information in `ofile` is the same as in `ifile1`.

Operators

add Add two fields
$o(t,x) = i_1(t,x) + i_2(t,x)$

sub Subtract two fields
$o(t,x) = i_1(t,x) - i_2(t,x)$

mul Multiply two fields
$o(t,x) = i_1(t,x) * i_2(t,x)$

div Divide two fields
$o(t,x) = i_1(t,x)/i_2(t,x)$

min Minimum of two fields
$o(t,x) = \min(i_1(t,x), i_2(t,x))$

max Maximum of two fields
$o(t,x) = \max(i_1(t,x), i_2(t,x))$

atan2 Arc tangent of two fields
The *atan*2 operator calculates the arc tangent of two fields. The result is in radians, which is between -PI and PI (inclusive).
$o(t,x) = \text{atan2}(i_1(t,x), i_2(t,x))$

Example

To sum all fields of the first input file with the corresponding fields of the second input file use:

```
cdo add ifile1 ifile2 ofile
```

2.7.5. YMONARITH - Multi-year monthly arithmetic

Synopsis

<operator> `ifile1 ifile2 ofile`

Description

This module performs simple arithmetic of a time series and a time step with the same month of year. For each field in `ifile1` the corresponding field of the time step in `ifile2` with the same month of year is used. The header information in `ifile1` must be the same as in `ifile2`. Usually `ifile2` is generated by a call of the module YMONSTAT.

Operators

ymonadd Add multi-year monthly time average
Adds a time series and a multi-year monthly time average.

ymonsub Subtract multi-year monthly time average
Subtracts a time series and a multi-year monthly time average.

ymonmul Multiply multi-year monthly time average
Multiplies a time series and a multi-year monthly time average.

ymondiv Divide multi-year monthly time average
Divides a time series and a multi-year monthly time average.

Example

To subtract a multi-year monthly time average from a time series, use:

```
cdo ymonsub ifile -ymonavg ifile ofile
```

2.7.6. ARITHDAYS - Arithmetic with days

Synopsis

<operator> `ifile ofile`

Description

This module multiplies or divides each time step of a dataset with the corresponding days per month or days per year.

Operators

muldpm Multiply with days per month
$o(t,x) = i(t,x) * days\_per\_month$

divdpm Divide by days per month
$o(t,x) = i(t,x)/days\_per\_month$

muldpy Multiply with days per year
$o(t,x) = i(t,x) * days\_per\_year$

divdpy Divide by days per year
$o(t,x) = i(t,x)/days\_per\_year$

Example

Assume an input dataset is a monthly mean time series. To compute the yearly mean from the correct weighted monthly mean use:

```
cdo muldpm ifile tmpfile1
cdo yearavg tmpfile1 tmpfile2
cdo mulc,12 -divdpy tmpfile2 ofile
```

Or all in one command line:

```
cdo mulc,12 -divdpy -yearavg -muldpm ifile ofile
```

2.8. Statistical values

This section contains modules to compute statistical values of datasets. In this program there is the different notion of "mean" and "average" to distinguish two different kinds of treatment of missing values. While computing the mean, only the not missing values are considered to belong to the sample with the side effect of a probably reduced sample size. Computing the average is just adding the sample members and divide the result by the sample size. For example, the mean of 1, 2, miss and 3 is (1+2+3)/3 = 2, whereas the average is (1+2+miss+3)/4 = miss/4 = miss. If there are no missing values in the sample, the average and the mean are identical. In this section the abbreviations as in the following table are used:

sum	$\sum_{i=1}^{n} x_i$
mean resp. **avg**	$n^{-1} \sum_{i=1}^{n} x_i$
mean resp. **avg** weighted by $\{w_i, i = 1, ..., n\}$	$\left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{i=1}^{n} w_i \, x_i$
Variance **var**	$n^{-1} \sum_{i=1}^{n} (x_i - \overline{x})^2$
var weighted by $\{w_i, i = 1, ..., n\}$	$\left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{i=1}^{n} w_i \left(x_i - \left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{j=1}^{n} w_j \, x_j \right)^2$
Standard deviation **std**	$\sqrt{n^{-1} \sum_{i=1}^{n} (x_i - \overline{x})^2}$
std weighted by $\{w_i, i = 1, ..., n\}$	$\sqrt{\left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{i=1}^{n} w_i \left(x_i - \left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{j=1}^{n} w_j \, x_j \right)^2}$

Here is a short overview of all operators in this section:

ensmin	Ensemble minimum
ensmax	Ensemble maximum
enssum	Ensemble sum
ensmean	Ensemble mean
ensavg	Ensemble average
ensstd	Ensemble standard deviation
ensvar	Ensemble variance
fldmin	Field minimum
fldmax	Field maximum
fldsum	Field sum

yseasstd	Multi-year seasonally standard deviation

2.8.1. ENSSTAT - Statistical values over an ensemble

Synopsis

<operator> `ifiles ofile`

Description

This module computes statistical values over an ensemble of input files. Depending on the actual operator the minimum, maximum, sum, average or standard deviation over all input files is written to `ofile`. The date information for a time step in `ofile` is the date of the first input file.

Operators

ensmin Ensemble minimum
$o(t,x) = \mathbf{min}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensmax Ensemble maximum
$o(t,x) = \mathbf{max}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

enssum Ensemble sum
$o(t,x) = \mathbf{sum}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensmean Ensemble mean
$o(t,x) = \mathbf{mean}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensavg Ensemble average
$o(t,x) = \mathbf{avg}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensstd Ensemble standard deviation
$o(t,x) = \mathbf{std}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensvar Ensemble variance
$o(t,x) = \mathbf{var}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

Example

To compute the ensemble mean over 6 input files, use:

```
cdo ensmean ifile1 ifile2 ifile3 ifile4 ifile5 ifile6 ofile
```

Or shorter with filename substitution:

```
cdo ensmean ifile[1-6] ofile
```

2.8.2. FLDSTAT - Statistical values over a field

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values of the input fields. According to the actual operator the field minimum, maximum, sum, average, standard deviation or variance is written to `ofile`.

Operators

fldmin Field minimum
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{min}\{i(t,x'), x_1 < x' \leq x_n\}$

fldmax Field maximum
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{max}\{i(t,x'), x_1 < x' \leq x_n\}$

fldsum Field sum
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{sum}\{i(t,x'), x_1 < x' \leq x_n\}$

fldmean Field mean
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{mean}\{i(t,x'), x_1 < x' \leq x_n\}$
weighted by area weights obtained by the input field.

fldavg Field average
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{avg}\{i(t,x'), x_1 < x' \leq x_n\}$
weighted by area weights obtained by the input field.

fldstd Field standard deviation
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{std}\{i(t,x'), x_1 < x' \leq x_n\}$
weighted by area weights obtained by the input field.

fldvar Field variance
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{var}\{i(t,x'), x_1 < x' \leq x_n\}$
weighted by area weights obtained by the input field.

Example

To compute the field mean of all input fields, use:

```
cdo fldmean ifile ofile
```

2.8.3. ZONSTAT - Zonal statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes zonal statistical values of the input fields. According to the actual operator the zonal minimum, maximum, sum, average, standard deviation or variance is written to `ofile`. All input fields must have the same rectangular grid.

Operators

zonmin Zonal minimum
For every latitude the minimum over all longitudes is computed.

zonmax Zonal maximum
For every latitude the maximum over all longitudes is computed.

zonsum Zonal sum
For every latitude the sum over all longitudes is computed.

zonmean Zonal mean
For every latitude the mean over all longitudes is computed.

zonavg Zonal average
For every latitude the average over all longitudes is computed.

zonstd Zonal standard deviation
For every latitude the standard deviation over all longitudes is computed.

zonvar Zonal variance
For every latitude the variance over all longitudes is computed.

Example

To compute the zonal mean of all input fields, use:

```
cdo zonmean ifile ofile
```

2.8.4. MERSTAT - Meridional statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes meridional statistical values of the input fields. According to the actual operator the meridional minimum, maximum, sum, average, standard deviation or variance is written to `ofile`. All input fields must have the same rectangular grid.

Operators

mermin Meridional minimum
For every longitude the minimum over all latitudes is computed.

mermax Meridional maximum
For every longitude the maximum over all latitudes is computed.

mersum Meridional sum
For every longitude the sum over all latitudes is computed.

mermean Meridional mean
For every longitude the area weighted mean over all latitudes is computed.

meravg Meridional average
For every longitude the area weighted average over all latitudes is computed.

merstd Meridional standard deviation
For every longitude the standard deviation over all latitudes is computed.

mervar Meridional variance
For every longitude the variance over all latitudes is computed.

Example

To compute the meridional mean of all input fields, use:

```
cdo mermean ifile ofile
```

2.8.5. VERTSTAT - Vertical statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over all levels of the input variables. According to actual operator the vertical minimum, maximum, sum, average, standard deviation or variance is written to `ofile`.

Operators

vertmin Vertical minimum
For every gridpoint the minimum over all levels is computed.

vertmax Vertical maximum
For every gridpoint the maximum over all levels is computed.

vertsum Vertical sum
For every gridpoint the sum over all levels is computed.

vertmean Vertical mean
For every gridpoint the mean over all levels is computed.

vertavg Vertical average
For every gridpoint the average over all levels is computed.

vertstd Vertical standard deviation
For every gridpoint the standard deviation over all levels is computed.

Example

To compute the vertical sum of all input variables, use:

```
cdo vertsum ifile ofile
```

2.8.6. SELSTAT - Time range statistical values

Synopsis

<operator>,nsets[,noffset[,nskip]] `ifile ofile`

Description

This module computes statistical values for a selected number of time steps. According to the actual operator the average, minimum, maximum, sum, average or standard deviation of the selected time steps is written to `ofile`.

Operators

selmin Time range minimum
For every adjacent sequence $t_1, ..., t_n$ of timesteps of the same selected time range, it is: $o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

selmax Time range maximum
For every adjacent sequence $t_1, ..., t_n$ of timesteps of the same selected time range, it is: $o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

selsum Time range sum
For every adjacent sequence $t_1, ..., t_n$ of timesteps of the same selected time range, it is: $o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

selmean Time range mean
For every adjacent sequence $t_1, ..., t_n$ of timesteps of the same selected time range, it is: $o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

selavg Time range average
For every adjacent sequence $t_1, ..., t_n$ of timesteps of the same selected time range, it is: $o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

selstd Time range standard deviation
For every adjacent sequence $t_1, ..., t_n$ of timesteps of the same selected time range, it is: $o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Parameter

nsets	INTEGER	Number of input time steps for each output time step
noffset	INTEGER	Number of input time steps skipped before the first time step range (optional)
nskip	INTEGER	Number of input time steps skipped between time step ranges (optional)

Example

Assume an input dataset has monthly means over several years. To compute seasonal means from monthly means the first two month must be skipped:

```
cdo selmean,3,2 ifile ofile
```

2.8.7. RUNSTAT - Running statistical values

Synopsis

<operator>,nts `ifile ofile`

Description

This module computes running statistical values over a selected number of time steps. Depending on the actual operator the minimum, maximum, sum, average or standard deviation of a selected number of consecutive time steps read from `ifile` is written to `ofile`. The date information in `ofile` is the date of the medium contributing time step in `ifile`.

Operators

runmin Running minimum
$o(t + (nts - 1)/2, x) = \mathbf{min}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\}$

runmax Running maximum
$o(t + (nts - 1)/2, x) = \mathbf{max}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\}$

runsum Running sum
$o(t + (nts - 1)/2, x) = \mathbf{sum}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\}$

runmean Running mean
$o(t + (nts - 1)/2, x) = \mathbf{mean}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\}$

runavg Running average
$o(t + (nts - 1)/2, x) = \mathbf{avg}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\}$

runstd Running standard deviation
$o(t + (nts - 1)/2, x) = \mathbf{std}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\}$

Parameter

nts INTEGER Number of time steps

Example

To compute the running mean over 9 time steps, use:

```
cdo runmean,9 ifile ofile
```

2.8.8. TIMSTAT - Statistical values over all time steps

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over all time steps in `ifile`. Depending on the actual operator the minimum, maximum, sum, average or standard deviation of all time steps read from `ifile` is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

timmin Time minimum
$o(1,x) = \mathbf{min}\{i(t',x), t_1 < t' \leq t_n\}$

timmax Time maximum
$o(1,x) = \mathbf{max}\{i(t',x), t_1 < t' \leq t_n\}$

timsum Time sum
$o(1,x) = \mathbf{sum}\{i(t',x), t_1 < t' \leq t_n\}$

timmean Time mean
$o(1,x) = \mathbf{mean}\{i(t',x), t_1 < t' \leq t_n\}$

timavg Time average
$o(1,x) = \mathbf{avg}\{i(t',x), t_1 < t' \leq t_n\}$

timstd Time standard deviation
$o(1,x) = \mathbf{std}\{i(t',x), t_1 < t' \leq t_n\}$

Example

To compute the mean over all input time steps, use:

```
cdo timmean ifile ofile
```

2.8.9. HOURSTAT - Hourly statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same hour. Depending on the actual operator the minimum, maximum, sum, average or standard deviation of time steps of the same hour is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

hourmin Hourly minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

hourmax Hourly maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

hoursum Hourly sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

hourmean Hourly mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

houravg Hourly average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

hourstd Hourly standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Example

To compute the hourly mean of a time series, use:

```
cdo hourmean ifile ofile
```

2.8.10. DAYSTAT - Daily statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same day. Depending on the actual operator the minimum, maximum, sum, average or standard deviation of time steps of the same day is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

daymin Daily minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

daymax Daily maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

daysum Daily sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

daymean Daily mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

dayavg Daily average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

daystd Daily standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Example

To compute the daily mean of a time series, use:

```
cdo daymean ifile ofile
```

2.8.11. MONSTAT - Monthly statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same month. Depending on the actual operator the minimum, maximum, sum, average or standard deviation of time steps of the same month is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

monmin Monthly minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

monmax Monthly maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

monsum Monthly sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

monmean Monthly mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

monavg Monthly average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

monstd Monthly standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Example

To compute the monthy mean of a time series, use:

```
cdo monmean ifile ofile
```

2.8.12. YEARSTAT - Yearly statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same year. Depending on the actual operator the minimum, maximum, sum, average or standard deviation of time steps of the same year is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

yearmin Yearly minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

yearmax Yearly maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

yearsum Yearly sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

yearmean Yearly mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

yearavg Yearly average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

yearstd Yearly standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Example

To compute the yearly mean of a time series, use:

```
cdo yearmean ifile ofile
```

2.8.13. SEASSTAT - Seasonally statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same season. Depending on the actual operator the minimum, maximum, sum, average or standard deviation of time steps of the same season is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`. Be careful about the first and the last output time step, they may be incorrect values if the seasons have incomplete time steps.

Operators

seasmin Seasonally minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

seasmax Seasonally maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

seassum Seasonally sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

seasmean Seasonally mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

seasavg Seasonally average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

seasstd Seasonally standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Example

To compute the seasonally mean of a time series, use:

```
cdo seasmean ifile ofile
```

2.8.14. YDAYSTAT - Multi-year daily statistical values

Synopsis

<operator> `ifile ofile`

Description

This module writes to `ofile`, according to the actual operator, the minimum, maximum, sum, average or standard deviation of each day of year in `ifile`. The date information in an output field is the date of the last contributing input field.

Operators

ydaymin Multi-year daily minimum

$$o(001,x) = \mathbf{min}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{min}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydaymax Multi-year daily maximum

$$o(001,x) = \mathbf{max}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{max}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydaymean Multi-year daily mean

$$o(001,x) = \mathbf{mean}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{mean}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydayavg Multi-year daily average

$$o(001,x) = \mathbf{avg}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{avg}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydaystd Multi-year daily standard deviation

$$o(001,x) = \mathbf{std}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{std}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

Example

To compute the daily mean over all input years, use:

```
cdo ydaymean ifile ofile
```

2.8.15. YMONSTAT - Multi-year monthly statistical values

Synopsis

<operator> `ifile ofile`

Description

This module writes to `ofile`, according to the actual operator, the minimum, maximum, sum, average or standard deviation of each month of year in `ifile`. The date information in an output field is the date of the last contributing input field.

Operators

ymonmin Multi-year monthly minimum

$$o(01,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonmax Multi-year monthly maximum

$$o(01,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonmean Multi-year monthly mean

$$o(01,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonavg Multi-year monthly average

$$o(01,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonstd Multi-year monthly standard deviation

$$o(01,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 12\}$$

Example

To compute the monthly mean over all input years, use:

```
cdo ymonmean ifile ofile
```

2.8.16. YSEASSTAT - Multi-year seasonally statistical values

Synopsis

<*operator*> `ifile ofile`

Description

This module writes to `ofile`, according to the actual operator, the minimum, maximum, sum, average or standard deviation of each season in `ifile`. The date information in an output field is the date of the last contributing input field.

Operators

yseasmin Multi-year seasonally minimum
$o(1,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseasmax Multi-year seasonally maximum
$o(1,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseasmean Multi-year seasonally mean
$o(1,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseasavg Multi-year seasonally average
$o(1,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseasstd Multi-year seasonally standard deviation
$o(1,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

Example

To compute the seasonally mean over all input years, use:

```
cdo yseasmean ifile ofile
```

2.9. Regression

This sections contains modules for linear regression of time series.

Here is a short overview of all operators in this section:

detrend	Detrend
trend	Trend
subtrend	Subtract trend

2.9.1. DETREND - Detrend time series

Synopsis

detrend `ifile ofile`

Description

Every time series in `ifile` is linearly detrended. For every field element x only those time steps t belong to the sample $S(x)$, which have $i(t,x) \neq \text{miss}$. With

$$a(x) = \frac{1}{\#S(x)} \sum_{t \in S(x)} i(t,x) - b(x) \left(\frac{1}{\#S(x)} \sum_{t \in S(x)} t \right)$$

and

$$b(x) = \frac{\sum_{t \in S(x)} \left(i(t,x) - \frac{1}{\#S(x)} \sum_{t' \in S(x)} i(t',x) \right) \left(t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)}{\sum_{t \in S(x)} \left(t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)^2}$$

it is

$$o(t,x) = i(t,x) - (a(x) + b(x)t)$$

This operator has to keep the fields of all time steps concurrently in the memory. If not enough memory is available, use the operators trend and subtrend.

Example

To detrend the data in `ifile` and to store the detrended data in `ofile`, use:

```
cdo detrend ifile ofile
```

2.9.2. TREND - Trend of time series

Synopsis

trend `ifile ofile1 ofile2`

Description

The values of the input file `ifile` are assumed to be distributed as $N(a+bt, \sigma^2)$ with unknown a, b and σ^2. This operator estimates the parameter a and b. For every field element x only those time steps t belong to the sample $S(x)$, which have $i(t,x) \neq$ miss. It is

$$o_1(1,x) = \frac{1}{\#S(x)} \sum_{t \in S(x)} i(t,x) - b(x) \left(\frac{1}{\#S(x)} \sum_{t \in S(x)} t \right)$$

and

$$o_2(1,x) = \frac{\sum_{t \in S(x)} \left(i(t,x) - \frac{1}{\#S(x)} \sum_{t' \in S(x)} i(t',x) \right) \left(t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)}{\sum_{t \in S(x)} \left(t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)^2}$$

Thus the estimation for a is stored in `ofile1` and that for b is stored in `ofile2`. To subtract the trend from the data see operator subtrend.

2.9.3. SUBTREND - Subtract a trend

Synopsis

subtrend `ifile1 ifile2 ifile3 ofile`

Description

This operator is for subtracting a trend computed by the operator trend. It is

$$o(t,x) = i_1(t,x) - (i_2(1,x) + i_3(1,x) \cdot t)$$

where t is the time steps.

Example

The typical call for detrend the data in `ifile` and to store the detrended data in `ofile` is:

```
cdo trend ifile afile bfile
cdo subtrend ifile afile bfile ofile
```

The result is identical to operator detrend:

```
cdo detrend ifile ofile
```

2.10. Interpolation

This section contains modules to interpolate datasets. There are several operators to interpolate horizontal fields to a new grid. Some of those operators can handle only 2D fields on a regular rectangular grid. Vertical interpolation of 3D variables is possible from hybrid model level to height or pressure level. Interpolation in time is possible between time steps and between years.

Here is a short overview of all operators in this section:

remapbil	Bilinear interpolation
remapbic	Bicubic interpolation
remapcon	Conservative remapping
remapdis	Distance-weighted averaging
genbil	Generate bilinear interpolation weights
genbic	Generate bicubic interpolation weights
gencon	Generate conservative interpolation weights
gendis	Generate distance-weighted averaging weights
remap	SCRIP grid remapping
interpolate	PINGO grid interpolation
intgridbil	Bilinear grid interpolation
ml2pl	Model to pressure level interpolation
ml2hl	Model to height level interpolation
inttime	Time interpolation
intyear	Year interpolation

2.10.1. REMAPGRID - SCRIP grid interpolation

Synopsis

<operator>,grid `ifile ofile`

Description

This module contains operators to interpolate all input fields to a new grid. Each operator is using a different remapping method. The interpolation is based on a special SCRIP library version. For a detailed description of the remapping methods see [SCRIP].

Operators

remapbil Bilinear interpolation
Performs a bilinear interpolation on all input fields. This interpolation method works only on rectangular grids.

remapbic Bicubic interpolation
Performs a bicubic interpolation on all input fields. This interpolation method works only on rectangular grids.

remapcon Conservative remapping
Performs a first order conservative remapping on all input fields.

remapdis Distance-weighted averaging
Performs a distance-weighted average of the four nearest neighbor values on all input fields.

Parameter

grid STRING Target grid description file or name

Environment

`NORMALIZE_OPT` This variable is used to choose the normalization of the conservative remapping. By default, NORMALIZE_OPT is set to be 'fracarea' and will include the destination area fraction in the output weights; other options are 'none' and 'destarea' (for more information see [SCRIP]).

Note

For this program the author has converted the original Fortran 90 SCRIP software to ANSI C. In case of any problems send a bug report to CDO and not to SCRIP!

Example

Say `ifile` contains fields on a rectangular grid. Remap all fields bilinear to a T42 gaussian grid:

```
cdo remapbil,t42grid ifile ofile
```

2.10.2. GENWEIGHTS - Generate SCRIP grid interpolation weights

Synopsis

<operator>,grid `ifile ofile`

Description

Grid interpolation can be a very time consuming process. Especially if the data is on an unstructured or on a large grid. In this case the SCRIP interpolation process can be split into two parts. First generation of the interpolation weights, this is the most time consuming part. These interpolation weights can be reused for every remapping process. This method works only if all input fields are on the same grid and a possibly mask (missing values) does not change. This module contains operators to generate SCRIP interpolation weights of the first input field. Each operator is using a different interpolation method.

Operators

genbil Generate bilinear interpolation weights
Generates bilinear interpolation weights and write the result to a file. This interpolation method works only on rectangular grids.

genbic Generate bicubic interpolation weights
Generates bicubic interpolation weights and write the result to a file. This interpolation method works only on rectangular grids.

gencon Generate conservative interpolation weights
Generates first order conservative interpolation weights and write the result to a file.

gendis Generate distance-weighted averaging weights
Generates distance-weighted average weights of the four nearest neighbor values and write the result to a file.

Parameter

grid STRING Target grid description file or name

Environment

`NORMALIZE_OPT` This variable is used to choose the normalization of the conservative interpolation. By default, NORMALIZE_OPT is set to be 'fracarea' and will include the destination area fraction in the output weights; other options are 'none' and 'destarea' (for more information see [SCRIP]).

Note

For this program the author has converted the original Fortran 90 SCRIP software to ANSI C. In case of any problems send a bug report to CDO and not to SCRIP!

Example

Say `ifile` contains fields on a rectangular grid. Remap all fields bilinear to a T42 gaussian grid:

```
cdo genbil,t42grid ifile remapweights.nc
cdo remap,t42grid,remapweights ifile ofile
```

2.10.3. REMAP - SCRIP grid remapping

Synopsis

remap,*grid*,*weights* `ifile ofile`

Description

This operator remaps all input fields to a new grid. The remap type and the interpolation weights of one grid are read from a netCDF file. The netCDF file with the weights must follow the SCRIP convention. Normaly these weights come from a previous call to module GENWEIGHTS or was created by the original SCRIP package.

Parameter

grid	STRING	Target grid description file or name
weights	STRING	Interpolation weights (SCRIP netCDF file)

Note

For this program the author has converted the original Fortran 90 SCRIP software to ANSI C. In case of any problems send a bug report to CDO and not to SCRIP!

Example

Say `ifile` contains fields on a regular grid. Remap all fields bilinear to a T42 gaussian grid:

```
cdo genbil,t42grid ifile remapweights.nc
cdo remap,t42grid,remapweights ifile ofile
```

2.10.4. INTGRID - Grid interpolation

Synopsis

<operator>,grid `ifile ofile`

Description

This module contains operators to interpolate all input fields to a new grid. All interpolation methods in this module work only on rectangular grids.

Operators

interpolate PINGO grid interpolation
This is the grid interpolation from PINGO. The basis of the interpolation is an underlying continuous field which is constructed in the following way. For two neighboured longitudes x_1 and x_2 and two neighboured latitudes y_1 and y_2 of the input grid every point at longitude x and latidude y with $x_1 \leq x \leq x_2$ and $y_1 \leq y \leq y_2$ is assigned the value

$$\begin{aligned} a &= a_{11} + (a_{21} - a_{11})\frac{x - x_1}{x_2 - x_1} + (a_{12} - a_{11})\frac{y - y_1}{y_2 - y_1} \\ &\quad + (a_{22} - a_{21} - a_{12} + a_{11})\frac{(x - x_1)(y - y_1)}{(x_2 - x_1)(y_2 - y_1)} \end{aligned}$$

where a_{ij} is the value at longitude x_i and latitude y_j. If one of the four values a_{11}, a_{12}, a_{21}, a_{22} is the missing value, then a is also the missing value. Afterwards the underlying continuous field is expanded by a half mesh width. For a detailed description of this interpolation method see [PINGO].

intgridbil Bilinear grid interpolation
Performs a bilinear interpolation on all input fields. This implementation is a faster than remapbil. Missing values are not supported yet!

Parameter

grid	STRING	Target grid description file or name

Example

Say `ifile` contains fields on a rectangular grid. To interpolate all fields bilinear to a T42 gaussian grid, use:

```
cdo intgridbil,t42grid ifile ofile
```

2.10.5. INTVERT - Vertical interpolation

Synopsis

ml2pl,*plevels* `ifile ofile`

ml2hl,*hlevels* `ifile ofile`

Description

Interpolate 3D variables on hybrid model level to pressure or height level. The input file must contain the log. surface pressure (LSP/code152) or the surface pressure (APS/code134). To interpolate the temperature, the orography (GEOSP/code129) is also needed.

Operators

ml2pl Model to pressure level interpolation
Interpolates 3D variables on hybrid model level to pressure level.

ml2hl Model to height level interpolation
Interpolates 3D variables on hybrid model level to height level. The procedure is the same as for operator mh2pl except that the pressure levels are calculated from the heights by: $plev = 101325 * exp(hlev/-7000)$

Parameter

plevels	FLOAT	Pressure levels in pascal
hlevels	FLOAT	Height levels in meter (max level: 65535 m)

Environment

`EXTRAPOLATE` If set to 1 extrapolate missing values.

Example

To interpolate hybrid model level data to pressure levels of 925, 850, 500 and 200 hPa, use:

```
cdo ml2pl,92500,85000,50000,20000 ifile ofile
```

2.10.6. INTTIME - Time interpolation

Synopsis

inttime,*date*,*time*[,*inc*] `ifile ofile`

Description

This operator performs linear interpolation between time steps.

Parameter

date	STRING	Start date (format YYYY-MM-DD)
time	STRING	Start time (format HH:MM)
inc	STRING	Optional increment (minutes, hours or days) [default: 0hour]

Example

Assumed a 6 hourly dataset starts at 1987-01-01 12:00. To interpolate this time series to a 2 hourly dataset, use:

```
cdo inttime,1987-01-01,12:00,2hour ifile ofile
```

2.10.7. INTYEAR - Year interpolation

Synopsis

intyear,*years* `ifile1 ifile2 oprefix`

Description

This operator performs linear interpolation between two years time step by time step. Appends four digits with the year to `oprefix` to form the output file names.

Parameter

years	INTEGER	Comma separated list of years

Example

Assumed you have two monthly mean datasets over a year. The first dataset has 12 time steps for year 1985 and the second for year 1990. To interpolate the years between 1985 and 1990 month by month, use:

```
cdo intyear,1986,1987,1988,1989 ifile1 ifile2 year
```

Example result of '`dir year*`' for netCDF datasets:

```
year1986.nc year1987.nc year1988.nc year1989.nc
```

2.11. Transformation

This section contains modules to perform spectral transformations.

Here is a short overview of all operators in this section:

sp2gp	Spectral to gridpoint
sp2gpl	Spectral to gridpoint linear
gp2sp	Gridpoint to spectral
gp2spl	Gridpoint to spectral linear
sp2sp	Spectral to spectral
uv2dv	U and V wind to divergence and vorticity
dv2uv	Divergence and vorticity to U and V wind

2.11.1. SPECTRAL - Spectral transformation

Synopsis

sp2gp `ifile ofile`

sp2gpl `ifile ofile`

gp2sp `ifile ofile`

gp2spl `ifile ofile`

sp2sp,*trunc* `ifile ofile`

Description

This module transforms fields on gaussian grids to spectral coefficients and vice versa.

Operators

sp2gp Spectral to gridpoint
Convert all fields with spectral coefficients to regular gaussian grid. The number of latitudes of the resulting gaussian grid is calculated from the triangular truncation by:
nlat = $NINT((\text{trunc} * \boxed{3} + 1.)/2.)$

sp2gpl Spectral to gridpoint linear
Convert all fields with spectral coefficients to regular gaussian grid. The number of latitudes of the resulting Gaussian grid is calculated from the triangular truncation by:
nlat = $NINT((\text{trunc} * \boxed{2} + 1.)/2.)$

Use this operator to convert ERA40 data e.g. from TL159 to N80.

gp2sp Gridpoint to spectral
Convert all gaussian gridpoint fields to spectral coefficients. The triangular truncation of the resulting spherical harmonics is calculated from the number of latitudes by:
trunc = $(\text{nlat} * 2 - 1)/\boxed{3}$

gp2spl Gridpoint to spectral linear
Convert all gaussian gridpoint fields to spectral coefficients. The triangular truncation of the resulting spherical harmonics is calculated from the number of latitudes by:
trunc = $(\text{nlat} * 2 - 1)/\boxed{2}$

Use this operator to convert ERA40 data e.g. from N80 to TL159 instead of T106.

sp2sp Spectral to spectral
Change the triangular truncation of all spectral fields. The operator performs downward conversion by cutting the resolution. Upward conversions are achieved by filling in zeros.

Parameter

trunc	INTEGER	New spectral resolution

Example

To transform spectral coefficients from T106 to N80 gaussian grid use:

```
cdo sp2gp ifile ofile
```

To transform spectral coefficients from TL159 to N80 gaussian grid use:

```
cdo sp2gpl ifile ofile
```

2.11.2. WIND - Wind transformation

Synopsis

<operator> `ifile ofile`

Description

This module converts divergence and vorticity to U and V wind and vice versa.

Operators

uv2dv U and V wind to divergence and vorticity
Calculate spherical harmonic coefficients of divergence and vorticity from U and V wind. The divergence and vorticity must have the names sd and svo or code numbers 155 and 138.

dv2uv Divergence and vorticity to U and V wind
Calculate U and V wind on a gaussian grid from spherical harmonic coefficients of divergence and vorticity. The U and V wind must have the names u and v or the code numbers 131 and 132.

Example

Assume a dataset has at least spherical harmonic coefficients of divergence and vorticity. To transform the spectral divergence and vorticity to U and V wind, use:

```
cdo dv2uv ifile ofile
```

2.12. Formatted I/O

This section contains modules to read and write ASCII data.

Here is a short overview of all operators in this section:

input	ASCII input
inputsrv	SERVICE input
inputext	EXTRA input
output	ASCII output
outputf	Formatted output
outputint	Integer output
outputsrv	SERVICE output
outputext	EXTRA output

2.12.1. INPUT - Formatted input

Synopsis

input,*grid* `ofile`

inputsrv `ofile`

inputext `ofile`

Description

This modules reads time series of one 2D variable from standard input. All input fields must have the same horizontal grid. The format of the input depends on the actual operator.

Operators

input ASCII input
Read fields with ASCII numbers from standard input and stores them in `ofile`. The numbers that are read are exactly that ones which are written out by output.

inputsrv SERVICE input
Read fields with ASCII numbers from standard input and stores them in `ofile`. Each field must have a header of 8 integers (SERVICE likely). The numbers that are read are exactly that ones which are written out by outputsrv.

inputext EXTRA input
Read fields with ASCII numbers from standard input and stores them in `ofile`. Each field with a header of 4 integers (EXTRA likely). The numbers that are read are exactly that ones which are written out by outputext.

Parameter

grid STRING Grid description file or name

Example

Assume an ASCII dataset contains a field on a global regular grid with 32 longitude and 16 latitudes (512 elements). To create a GRIB dataset from the ASCII dataset use:

```
cdo -f grb input,r32x16 ofile.grb < my_ascii_data
```

2.12.2. OUTPUT - Formatted output

Synopsis

output `ifiles`

outputf,*format*,*nelem* `ifiles`

outputint `ifiles`

outputsrv `ifiles`

outputext `ifiles`

Description

This modules prints all values of all input datasets to standard output. All input fields must have the same horizontal grid. The format of the output depends on the actual operator.

Operators

output ASCII output
Prints all values to standard output. Each row has 6 elements with the C-style format "%13.6g".

outputf Formatted output
Prints all values to standard output. The format and number of elements for each row can be specified by the parameters.

outputint Integer output
Prints all values rounded to the nearest interger to standard output.

outputsrv SERVICE output
Prints all values to standard output. Each field with a header of 8 integers (SERVICE likely).

outputext EXTRA output
Prints all values to standard output. Each field with a header of 4 integers (EXTRA likely).

Parameter

format	STRING	C-style format for one element (e.g. %13.6g)
nelem	INTEGER	Number of elements for each row

Example

To print all field elements of a dataset formatted with "%8.4g" and 8 values per line use:

```
cdo outputf,%8.4g,8 ifile
```

Example result of a dataset with one field on 64 grid points:

```
 261.7     262   257.8   252.5   248.8   247.7   246.3   246.1
 250.6   252.6   253.9   254.8     252   246.6   249.7   257.9
 273.4   266.2   259.8   261.6   257.2   253.4     251   263.7
 267.5   267.4   272.2   266.7   259.6   255.2   272.9   277.1
 275.3   275.5   276.4   278.4     282   269.6   278.7   279.5
 282.3   284.5   280.3   280.3     280   281.5   284.7   283.6
 292.9   290.5   293.9   292.6   292.7   292.8   294.1   293.6
 293.8   292.6   291.2   292.6   293.2   292.8     291   291.2
```

2.13. Miscellaneous

This section contains miscellaneous modules which do not fit to the other sections before.

Here is a short overview of all operators in this section:

timsort	Sort over the time
const	Create a constant field
random	Create a field with random values
vardup	Duplicate variables
varmul	Multiply variables
gradsdes	GrADS data descriptor file
gradsdes2	GrADS data descriptor file (version 2 map)
rotuvb	Backward rotation
mastrfu	Mass stream function

2.13.1. TIMSORT - Timsort

Synopsis

timsort `ifile ofile`

Description

Sorts for every field position the elements in ascending order over all time steps. After sorting it is:
$o(t_1, x) < o(t_2, x) \qquad \forall (t_1 < t_2), x$

Example

To sort all field elements of a dataset over all time steps use:

```
cdo timsort ifile ofile
```

2.13.2. VARGEN - Generate a field

Synopsis

const,*const*,*grid* `ofile`

random,*grid* `ofile`

Description

Generates a dataset with one field. The size of the field is specified by the user given grid description. According to the actual operator all field elements are constant or filled with random numbers.

Operators

const	Create a constant field Creates a constant field. All field elements of the grid have the same value.
random	Create a field with random values Creates a field with rectangularly distrubuted random numbers in the interval [0,1].

Parameter

const	FLOAT	Constant
grid	STRING	Target grid description file or name

2.13.3. VARDUP - Variable duplication

Synopsis

vardup `ifile ofile`

varmul,*nmul* `ifile ofile`

Description

Duplicates all variables of a dataset.

Operators

vardup	Duplicate variables Duplicates all variables.
varmul	Multiply variables Multiplies all variables.

Parameter

nmul	INTEGER	Number of multiplications

2.13.4. GRADSDES - GrADS data descriptor file

Synopsis

<operator> `ifile`

Description

Creates a GrADS data descriptor file. Supported file formats are GRIB, SERVICE, EXTRA and IEG. For GRIB files the GrADS map file is also generated. For SERVICE and EXTRA files the grid must be specified with the CDO option '-g <grid>'. This operator takes `ifile` in order to create filenames for the descriptor (`ifile.ctl`) and the map (`ifile.gmp`) file.

Operators

gradsdes GrADS data descriptor file
Creates a GrADS data descriptor file. Generated a machine specific version 1 GrADS map file for GRIB datasets.

gradsdes2 GrADS data descriptor file (version 2 map)
Creates a GrADS data descriptor file. Generated a machine independent version 2 GrADS map file for GRIB datasets. This map file can be used only with GrADS version 1.8 or newer.

Example

To create a GrADS data descriptor file from a GRIB dataset use:

```
cdo gradsdes ifile.grb
```

This will create a descriptor file with the name `ifile.ctl` and the map file `ifile.gmp`.
Assumed the input GRIB dataset has 3 variables over 12 time steps on a T21 grid. The contents of the resulting GrADS data description file is approximately:

```
DSET ^ifile.grb
DTYPE GRIB
INDEX ^ifile.gmp

2.13.5. ROTUV - Rotation

Synopsis

rotuvb,*u,v,...* `ifile ofile`

Description

This is a special operator for datsets with wind components on an rotated grid, e.g. data from the regional model REMO. It performs a backward transformation of velocity components U and V from an rotated spherical system to a geographical system.

Parameter

u,v,... STRING Pairs of zonal and meridional velocity components (use variable names or code numbers)

Example

To transform the u and v velocity of a dataset from an rotated spherical system to a geographical system use:

```
cdo rotuvb,u,v ifile ofile
```

2.13.6. MASTRFU - Mass stream function

Synopsis

mastrfu `ifile ofile`

Description

This is a special operator for the post processing of the atmospheric general circulation model ECHAM. It computes the mass stream function (code number 272). The input dataset must be a zonal mean of v-velocity (code number 132) on pressure levels.

Example

To compute the mass stream function from a zonal mean v-velocity dataset use:

```
cdo mastrfu ifile ofile
```

A. Hints for PINGO user

Some **CDO** operators have the same name as in PINGO but the meaning is different. The following table gives an overview of those operators.

Operator name	**CDO**	PINGO
min	Minimum of two fields	Time minimum
max	Maximum of two fields	Time maximum
daymean	Daily mean	Multi-year daily mean
daymin	Daily minimum	Multi-year daily minimum
daymax	Daily maximum	Multi-year daily maximum
monmean	Monthly mean	Multi-year monthly mean
monmin	Monthly minimum	Multi-year monthly minimum
monmax	Monthly maximum	Multi-year monthly maximum
seasmean	Seasonally mean	Multi-year seasonally mean

There are also some **CDO** operators with the same functionality as in PINGO but the name is different. The following table gives an overview of those operators.

	CDO	PINGO
Maximum of two fields	max	max2
Minimum of two fields	min	min2
Field mean, min, max	fldmean, fldmin, fldmax	meanr minr, maxr
Time mean, min, max	timmean, timmin, timmax	mean, min, max
Daily mean, min, max	daymean, daymin, daymax	daymeans, daymins, daymaxs
Monthly mean, min, max	monmean, monmin, monmax	monmeans, monmins, monmaxs
Yearly mean, min, max	yearmean, yearmin, yearmax	yearmeans, yearmins, yearmaxs
Running mean	runmean	runmeans
Seasonally mean	seasmean	seasmeans
Multi-year daily mean	ydaymean	daymean
Multi-year monthly mean	ymonmean	monmean
Multi-year seasonally mean	yseasmean	seasmean

B. Grid description examples

B.1. Example of a curvilinear grid description

Here is an example for the **CDO** description of a curvilinear grid. xvals/yvals describes the position of the 6x5 quadrilateral grid cells. The first 4 values of xbounds/ybounds are the corners of the first grid cell.

```
gridtype  : curvilinear
gridsize  : 30
xsize     : 6
ysize     : 5
xvals     :  -21  -11    0   11   21   30  -25  -13    0   13
              25   36  -31  -16    0   16   31   43  -38  -21
               0   21   38   52  -51  -30    0   30   51   64
xbounds   :  -23  -14  -17  -28       -14   -5   -6  -17        -5    5    6   -6
               5   14   17    6        14   23   28   17        23   32   38   28
             -28  -17  -21  -34       -17   -6   -7  -21        -6    6    7   -7
               6   17   21    7        17   28   34   21        28   38   44   34
             -34  -21  -27  -41       -21   -7   -9  -27        -7    7    9   -9
               7   21   27    9        21   34   41   27        34   44   52   41
             -41  -27  -35  -51       -27   -9  -13  -35        -9    9   13  -13
               9   27   35   13        27   41   51   35        41   52   63   51
             -51  -35  -51  -67       -35  -13  -21  -51       -13   13   21  -21
              13   35   51   21        35   51   67   51        51   63   77   67
yvals     :   29   32   32   32   29   26   39   42   42   42
              39   35   48   51   52   51   48   43   57   61
              62   61   57   51   65   70   72   70   65   58
ybounds   :   23   26   36   32        26   27   37   36        27   27   37   37
              27   26   36   37        26   23   32   36        23   19   28   32
              32   36   45   41        36   37   47   45        37   37   47   47
              37   36   45   47        36   32   41   45        32   28   36   41
              41   45   55   50        45   47   57   55        47   47   57   57
              47   45   55   57        45   41   50   55        41   36   44   50
              50   55   64   58        55   57   67   64        57   57   67   67
              57   55   64   67        55   50   58   64        50   44   51   58
              58   64   72   64        64   67   77   72        67   67   77   77
              67   64   72   77        64   58   64   72        58   51   56   64
```

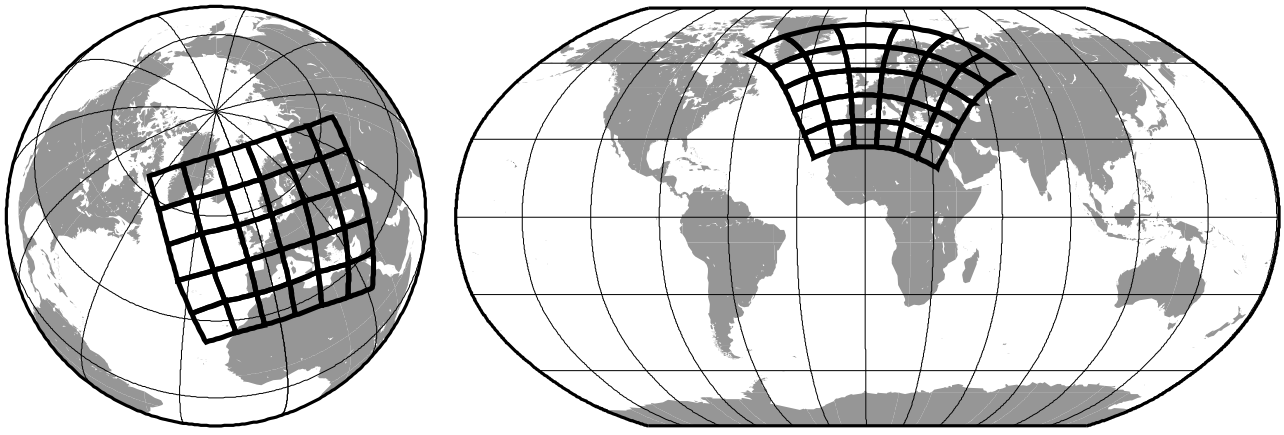

Figure B.1.: Orthographic and Robinson projection of the curvilinear grid

B.2. Example description for unstructured grid cells

Here is an example of the **CDO** description for unstructured grid cells. xvals/yvals describes the position of 30 independent hexagonal grid cells. The first 6 values of xbounds/ybounds are the corners of the first grid cell.

```
gridtype  : cell
gridsize  : 30
nvertex   : 6
xvals     :  -36   36    0  -18   18  108   72   54   90  180
              144  126  162 -108 -144 -162 -126  -72  -90  -54
                0   72   36  144  108 -144  180  -72 -108  -36
xbounds   :  339    0    0  288  288  309       21   51   72   72    0    0
                0   16   21    0  339  344      340    0   -0  344  324  324
               20   36   36   16    0    0       93  123  144  144   72   72
               72   88   93   72   51   56       52   72   72   56   36   36
